NOAA Chlorofluorocarbon Tracer Program

Air and Seawater Measurements: 1986–1989

D.P. Wisegarver¹, J.L. Bullister¹, R.H. Gammon², F.A. Menzia³, and K.C. Kelly¹

Abstract. The NOAA Chlorofluorocarbon (CFC) Tracer Program at PMEL has been measuring the growing burden of these anthropogenic gases in the thermocline waters of the Pacific Ocean since 1980. The central goals of the NOAA CFC Tracer Program are to document the transient invasion of the CFC tracers into the Pacific Ocean, by means of repeat occupations of key hydrographic sections at 5-year intervals, and to interpret these changing distributions in terms of coupled ocean-atmosphere models. Studies are underway to use the CFC observations in model-validation studies, and to help develop predictive capabilities on the decade-to-century timescale. This report includes measurements of trichlorofluoromethane (CFC-11) and dichlorodifluoromethane (CFC-12) dissolved in seawater samples collected in the Pacific Ocean by the NOAA CFC Tracer Program on six cruises during the period of 1986–1989. Measurements of depth, pressure, salinity, temperature, and dissolved oxygen are included with the CFC data. Measurements of CFC-11 and CFC-12 in air samples collected along the cruise tracks are also included in the report. Data from this report are also available from the authors in digital format.

1. INTRODUCTION

Analytical techniques have been developed which allow trace levels of CFCs to be measured reliably in the atmosphere and ocean. CFC studies are now included as integral parts of many hydrographic programs, including the World Ocean Circulation Experiment (WOCE). A number of recent studies have demonstrated the usefulness of dissolved CFCs as time-dependent (transient) tracers of ocean circulation and mixing processes (Bullister, 1989). The ocean plays a critical role as a sink, not only for carbon dioxide, the dominant climate forcing (greenhouse) gas, but for the greenhouse warming transient itself. Repeated surveys of the global subsurface ocean carried out at decadal intervals are needed to document the climatically forced changes in ventilation and circulation, as well as determine the evolving burden of carbon dioxide and other climate-linked trace gases. Studies of the entry of CFCs (and other tracers) into the ocean provide a unique description of the time-integrated circulation of the ocean on decadal time scales.

Investigators at NOAA/PMEL have been involved in CFC studies since the early 1980s (Gammon *et al.*, 1982). This program at PMEL has focused on studies in the Pacific Ocean during this period. The data included in this report were collected on six oceanographic cruises during the period 1986–1989. The names and dates of these cruises and the research vessel used are listed in Table 1. The location of stations occupied during the 1986–1989 interval are

¹ NOAA/Pacific Marine Environmental Laboratory, 7600 Sand Point Way NE, Seattle, WA 98115-0070.

displayed in Fig. 1. Figures 2 and 3 show the stations occupied during the first 5 years of the program (1981–1985; data to be presented in another report) and the most recent cruises (1990–1992).

Table 1. List of cruises.

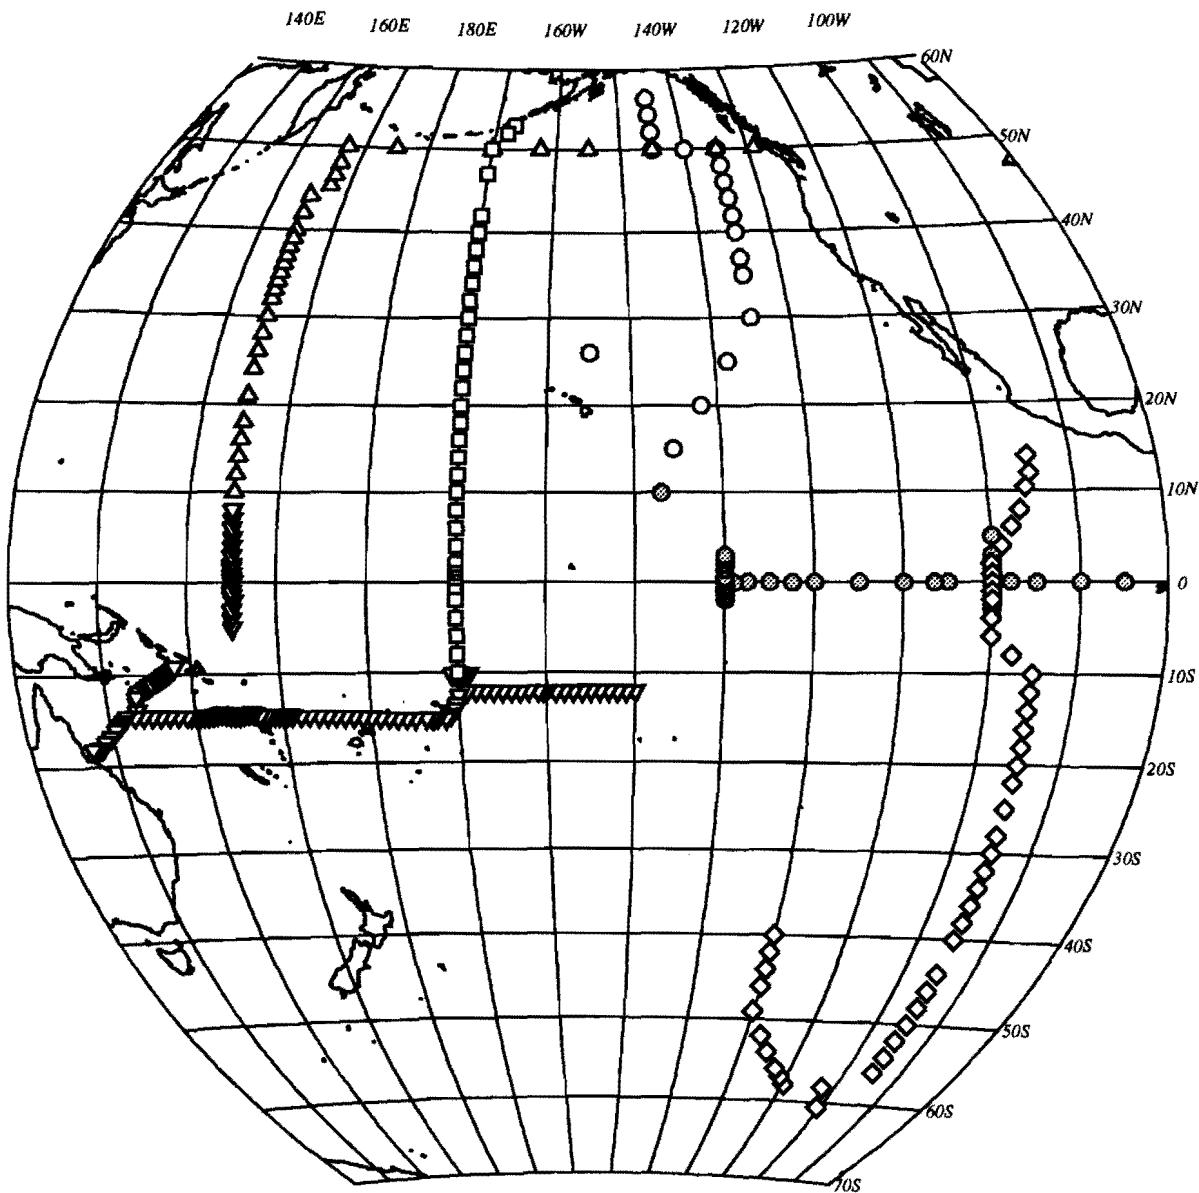

| Cruise Name | Cruise Dates | Research Vessel |
|----------------------------|-------------------------|----------------------|
| EPOCS-86 (EP2-86-OC) | 21 May–20 June 1986 | <i>Oceanographer</i> |
| CO2-86 (RPI-OC-86) | 30 June–22 July 1986 | <i>Oceanographer</i> |
| TEW (TW2-87-OC; TW3-87-OC) | 6 June–27 July 1987 | <i>Oceanographer</i> |
| CO2-87 (CO2-87-OC) | 30 July–28 August 1987 | <i>Oceanographer</i> |
| CO2-88 (OC-88-CO2) | 6 April–5 May 1988 | <i>Oceanographer</i> |
| CO2-89 (RTS-89-DI) | 15 February–20 May 1989 | <i>Discoverer</i> |

At each station on these cruises, vertical profiles of conductivity, temperature and depth were obtained using a Neil Brown Instruments System Mark III CTD, mounted on a General Oceanics Rosette. The rosette contained 12 (or 24) General Oceanics 10-liter Niskin Bottles, which were used to collect discrete seawater samples. A sub-sample was collected from each bottle for analysis of salinity and dissolved oxygen. Many of the bottles were also sampled for the analyses of CFCs, dissolved carbon dioxide, alkalinity, pH, nutrients, and other parameters. The CTD temperature, bottle salinity (CTD salinity, if a bottle salinity value is not available), bottle oxygen, CFC-11 and CFC-12 will be reported here. Measurements of dissolved carbon dioxide made on these cruises will be reported elsewhere.

1.1 CTD Data Processing

The CTD acquisition, processing and calibration procedures used on these cruises are documented in Mangum *et al.* (1991) and Mangum *et al.* (1980). At each station, the CTD/rosette package was lowered through the water column on an electrical/mechanical cable. The digitized CTD signal was recorded on magnetic tape in the ship's laboratory. Initial processing of the data at sea yielded preliminary values for temperature, salinity and pressure. Final calibration and processing of the CTD data was done at PMEL following the completion of the expedition.

The CTD instruments were calibrated at the Northwest Regional Calibration Center–NRCC (Seattle, WA) before and after each of the cruises included in this report. Although several reversing thermometers were used on most casts, the CTD pressure and temperature readings are considered to be more accurate and no corrections were applied from the thermometer data. Salinity samples drawn from each Niskin bottle were used to determine the calibration of the CTD conductivity cell. On several cruises, a dissolved oxygen sensor was mounted on the CTD,

and data from this sensor was logged with the CTD data stream. Discrete oxygen samples collected in Niskin Bottles were used to calibrate the oxygen sensor.

The CTD data for the EPOCS and TEW cruises are presented in Lynch *et al.* (1988) and Mangum *et al.* (1991). The CTD data from the other cruises will be presented in another report.

1.2 Salinity Data Processing

Seawater samples were analyzed for salinity on a Guildline Autosal salinometer. Vials of IAPSO Standard Seawater were used to calibrate the Autosal and were run before and after a batch of seawater samples (typically one station would be run as a batch). Data are reported in practical salinity units (PSU) discussed in Lewis and Fofonoff (1979).

1.3 Dissolved Oxygen Data Processing

Dissolved oxygen samples were analyzed using a modified Carpenter titration technique (Carpenter, 1965). During the TEW cruise, an automated version of the titration was used (Friedrich, 1991). Results are reported in $\mu\text{mole/kg}$. Equilibrium concentrations for dissolved oxygen are calculated using the solubility equations of Weiss (1970).

1.4 Chlorofluorocarbons (CFC) Analytical Techniques

To reduce CFC contamination from elastomers, the internal elastic tubing normally used to close Niskin Bottles was replaced with an epoxy-coated spring, and the end cap O-rings used to seal the Niskin bottles were vacuum-baked and changed prior to the first station.

When collected, CFC samples were the first samples drawn from the Niskin Bottles. To minimize contact with air, seawater samples were drawn through the stopcocks of the 10-liter Niskin bottles directly into 100-ml glass syringes (Becton Dickenson, model number 2317) with plastic stopcocks (Pharmaseal Type Pk-70). Syringes containing seawater samples were stored in a stainless steel holding tank, which was continuously flushed with a supply of clean surface seawater. The holding tank was placed on deck outside of the CFC laboratory. This reduced the possibility of contamination of the stored samples due to high CFC levels frequently encountered in enclosed laboratory space on board research vessels.

The CFC analyses were performed using an automated purge and trap, GC/ECD system described in Wisegarver and Cline (1985). Traces of CFCs in the carrier and purge gas supplies were removed by passing the gas streams through a 5-foot length of $\frac{1}{4}$ -inch stainless steel tubing, filled with 60/80 mesh molecular sieve 13x chromatographic packing material.

To initiate sample processing, a 30-ml aliquot of seawater from a glass syringe was transferred into the glass sparging chamber. The dissolved CFCs in the seawater sample were extracted by passing the supply of CFC-free purge gas through the sparging chamber for a period of 4 minutes. Water vapor was removed from the carrier while passing through a short tube of magnesium perchlorate. The sample gases were concentrated on a cold-trap consisting of a 3-inch

section of 1/8-inch stainless steel tubing packed with Porapak Q (60–80 mesh) immersed in a bath of ethanol held at –20°C. After 4 minutes of purging the seawater sample, the sparging chamber was closed and the trap isolated. The cold ethanol in the bath was forced away from the trap with nitrogen gas and the trap was heated electrically to 130°C. The sample gases held in the trap were swept onto a precolumn (12 inches of 1/8-inch O.D. stainless steel tubing packed with 80–100 mesh Porasil C, held at 70°C) for the initial separation of the CFCs and other rapidly eluting gases from more slowly eluting compounds. After the CFC-12 and CFC-11 had passed through the precolumn and into the main analytical column (10 feet, 1/8-inch stainless steel tubing packed with Porasil C, 80–100 mesh, 70°C), the precolumn was taken out of line. Compounds were separated as they passed through the main chromatographic column and exited into a Hewlett-Packard Electron Capture detector (ECD). The analog signal generated by compounds passing through the ECD was sent to either an HP3388 or an HP3396 integrator for quantifying the chromatographic peak areas.

The CFC analytical system was calibrated frequently using standard gas of known CFC composition. Gas sample loops of known volume were thoroughly flushed with standard gas and injected into the system. The temperature and pressure was recorded so that the amount of gas injected could be calculated. The procedures used to transfer the standard gas to the trap, precolumn, main chromatographic column and detector were similar to those used for analyzing water samples. Four sizes of gas sample loops were present in the analytical system, allowing the system to be calibrated over a relatively wide range of CFC concentrations. Air and system blanks were injected and analyzed in a similar manner. The typical analysis time for a seawater, air, blank or standard samples was about 12 minutes.

At the completion of each chromatographic analysis, the CFC-12 and CFC-11 peaks areas, along with information on run number, sample type, volume, temperature and pressure were stored in digital format. Following return to the laboratory, the data were transferred to a Sun SPARCstation computer for final processing. The techniques used for fitting multi-term expressions to the standard gas calibration data, correcting for analytical blanks, and calculating CFC-11 and CFC-12 concentrations in air and seawater samples are discussed in Bullister and Weiss (1988). Dissolved CFC concentrations are reported in units of picomoles/kg. The dissolved CFC-11 and CFC-12 saturation levels are determined from the atmospheric measurements made during the cruise and the solubilities of Warner and Weiss (1985).

1.5 CFC Flagging System

The last column in the data tables contains a 4-digit data quality flag. The first (leftmost) digit is used to differentiate between bottle and CTD derived salinity data. A value of 1 in this position indicates that the salinity value reported for the sample is from a bottle salinity measurement; a value of 2 in this position indicates that a bottle salinity was unavailable for that sample, and that the CTD-derived salinity value is reported. The three rightmost digits are flags

for the CFC measurements. A value of 0 in the hundreds position indicates that a single CFC measurement was made on the sample; a value of 1 in this position indicates that the CFC-11 and CFC-12 values reported for the sample are the means of replicate analyses. A value of 0 in the tens position indicates a normal CFC analytical result for the sample; a value of 1 indicates that the CFC-11 concentration is anomalous, perhaps due to analytical error or contamination. A value of 2 indicates an anomalous CFC-12 result, and a value of 3 indicates anomalous CFC-11 and CFC-12 results for the sample. The criteria for flagging anomalous CFC samples ("flyers") in this manner was based on the CFC content in surrounding samples. In some cases, unexpectedly high or low CFC concentrations obtained for a sample (relative to surrounding CFC samples) could not be correlated to other oceanographic properties, and are thought to be due to CFC contamination problems with that sample, or analytical errors. A discussion of the severe CFC contamination problems which are sometimes encountered on oceanographic expeditions is given in Bullister (1989). CFC samples flagged as anomalous are reported as -9 in this report and are not used to generate the CFC sections shown in the accompanying figures. A zero in the fourth (rightmost) digit indicates a normal chromatographic integration for the CFC sample. A value of 1 indicates that the CFC-11 peak area for the sample was not integrated by the integrator, but was instead estimated manually from the peak height on the chromatogram. A value of 2 in this position indicates the CFC-12 area was estimated, and a value of 3 in this position indicates that both the CFC-11 and CFC-12 peak areas were estimated for the sample. The flagging system is summarized in Table 2.

Table 2. Summary of flagging system used in report.
Flag Position (____)

| Position | Code |
|-----------------|---|
| (Left to Right) | |
| 1 | 1—Bottle salinity reported 2—CTD salinity reported |
| 2 | 0—Single CFC analysis 1—Average of replicate CFC analyses reported |
| 3 | 0—CFC values used in generating sections 1—Anomalous CFC-11 value; not used in generating CFC-11 section 2—Anomalous CFC-12 value; not used in generating CFC-12 section 3—Anomalous CFC-11 and CFC-12 values; not used in generating CFC-11 and CFC-12 sections |
| 4 | 0—Normal CFC peak area integrations 1—CFC-11 peak area estimated from peak height 2—CFC-12 peak area estimated from peak height 3—Both CFC-11 and CFC-12 peak areas estimated from peak heights |

Each cruise discussion section in this report lists the number of CFC samples flagged as anomalous ("flyers"), and discusses possible causes for the anomalous CFC results. Only grossly inconsistent CFC values have been flagged as anomalous. The authors should be contacted for additional information on individual data sets and possible revisions.

1.6 CFC Standardization

The CFC gas standard used during the 1986 field season was a cryogenically trapped air sample held in an AIRCO spectroseal cylinder collected in Seattle, WA during the winter of 1985–86. This working standard will be referred to as AIR0186. The CFC-11 and CFC-12 concentrations in AIR0186 were compared with those in a cryogenically trapped whole air sample (OGC #O-326) prepared and calibrated at the Oregon Graduate Center (OGC) by Dr. R. Rasmussen. The reported concentrations of CFC-11 and CFC-12 in the OGC working standard were 238.7 and 416 PPT (parts-per-trillion), respectively. The concentrations of CFC-11 and CFC-12 in AIR0186, relative to OGC #O-326 (e.g., on the OGC scale) were determined to be 579.9 and 242.1 PPT, respectively. A comparison of the OGC and SIO calibration scales is given in Bullister (1984). All CFC concentrations for air and seawater samples in this report are in the SIO86a scale; therefore, the original CFC-11 and CFC-12 data from the 1986 field season have been divided by factors of 1.0721 and 1.0259 (see Table 3).

In March 1987, Dr. M. Warner and Dr. R.F. Weiss calibrated PMEL standard cylinders #48232 and #48314 which had been filled with dry compressed air at Niwot Ridge, CO on 13–14 January 1987 by researchers at NOAA's Climate Monitoring and Diagnostics Laboratory (NOAA-CMDL). The CFC content of the two cylinders were respectively, 427.52 and 429.85 for CFC-12 and 231.89 and 239.18 for CFC-11. Subsequent analyses have shown that within the precision limits of the calibrations (less than $\pm 0.5\%$), there has been no significant drift in CFC-11 and CFC-12 concentrations.

Table 3. Summary of standards used for the calibration of the CFC analytical system. CFC concentrations are reported in the SIO 1986 scale (Bullister and Weiss, 1988).

| Cylinder # | Calibration | CFC-11 | CFC-12 | Year used |
|------------|------------------|--------|--------|------------|
| AIR0186 | vs. 0-326 at sea | 565.3 | 225.8 | 1986 |
| 48232 | at SIO | 231.89 | 427.52 | 1987, 1989 |
| 48314 | at SIO | 239.18 | 429.85 | 1988 |

1.7 CFC Air Measurements Techniques

Air samples were analyzed for CFC-11 and CFC-12 along the cruise tracks. On each cruise, an air inlet was mounted on the jackstaff of the vessel, and clean marine air was pumped into

the laboratory through Dekaron 3/8-inch O.D. tubing. This air stream could be flushed through the sample loops, and injected into the CFC analytical system. CFC concentrations for these samples are reported as mole fraction of the CFC in dry air. Air samples were normally analyzed when the wind was within 45 degrees of the ship's bow, to avoid sampling air which had passed over the ship. Air samples were normally analyzed in sets of three or more with a typical precision of 0.5% to 1.0% for both gases. The atmospheric measurements of CFC-11 and CFC-12 from 1986–1989 are shown in Fig. 4.

These samples were used to determine the temporal and spatial distribution of CFCs in the near-surface atmosphere along the ship tracks. These atmospheric measurements, together with CFC solubility data and measurements of sea surface temperature and salinity, are used to calculate equilibrium concentrations of dissolved CFCs in surface waters at the time of the cruise. These calculations and the CFC ratios are only listed where concentrations exceed 0.03 pmole/kg in the water column.

1.8 CFC Blank Corrections

Two types of blank corrections were applied to the CFC samples. An analytical (or "system") blank, derived from the analysis of CFC-free gas, was subtracted from standard and air samples. CFC-11 and CFC-12 peak areas generated from analysis of analytical blanks were typically less than 1% of those for standard or air samples.

Estimates of seawater blanks were sometimes more difficult to determine. CFC contamination can occur during storage of the seawater sample in a Niskin Bottle, glass syringe, or sparging chamber; during the seawater transfer procedures, and during sample analysis.

In most cases, the estimates of the CFC seawater blanks for a station (or group of adjacent stations) are based on analysis of deep water samples in that area. In much of the deep North Pacific below a depth of 2000 meters, the waters are relatively isolated from recent atmospheric contact, and there has been little penetration of anthropogenic tracers such as tritium and bomb radiocarbon during the past 40 years (Broecker, 1981). At present, deep waters in most of this region should contain negligible levels of dissolved CFCs. The presence of measurable levels of dissolved CFCs in these deep samples is an indication of the magnitude of the CFC blank due to sample collection and processing.

For most samples, the average estimated blank correction was less than 0.01 pmol/kg for both CFC-11 and CFC-12. In some cases, higher and more variable CFC seawater blanks were observed, especially during the first few stations of a cruise. These blanks are thought to be due mainly to release of CFCs from the Niskin Bottle walls and O-rings into the samples.

The blank corrections applied to the seawater samples in this report are tabulated in the discussion section of each cruise.

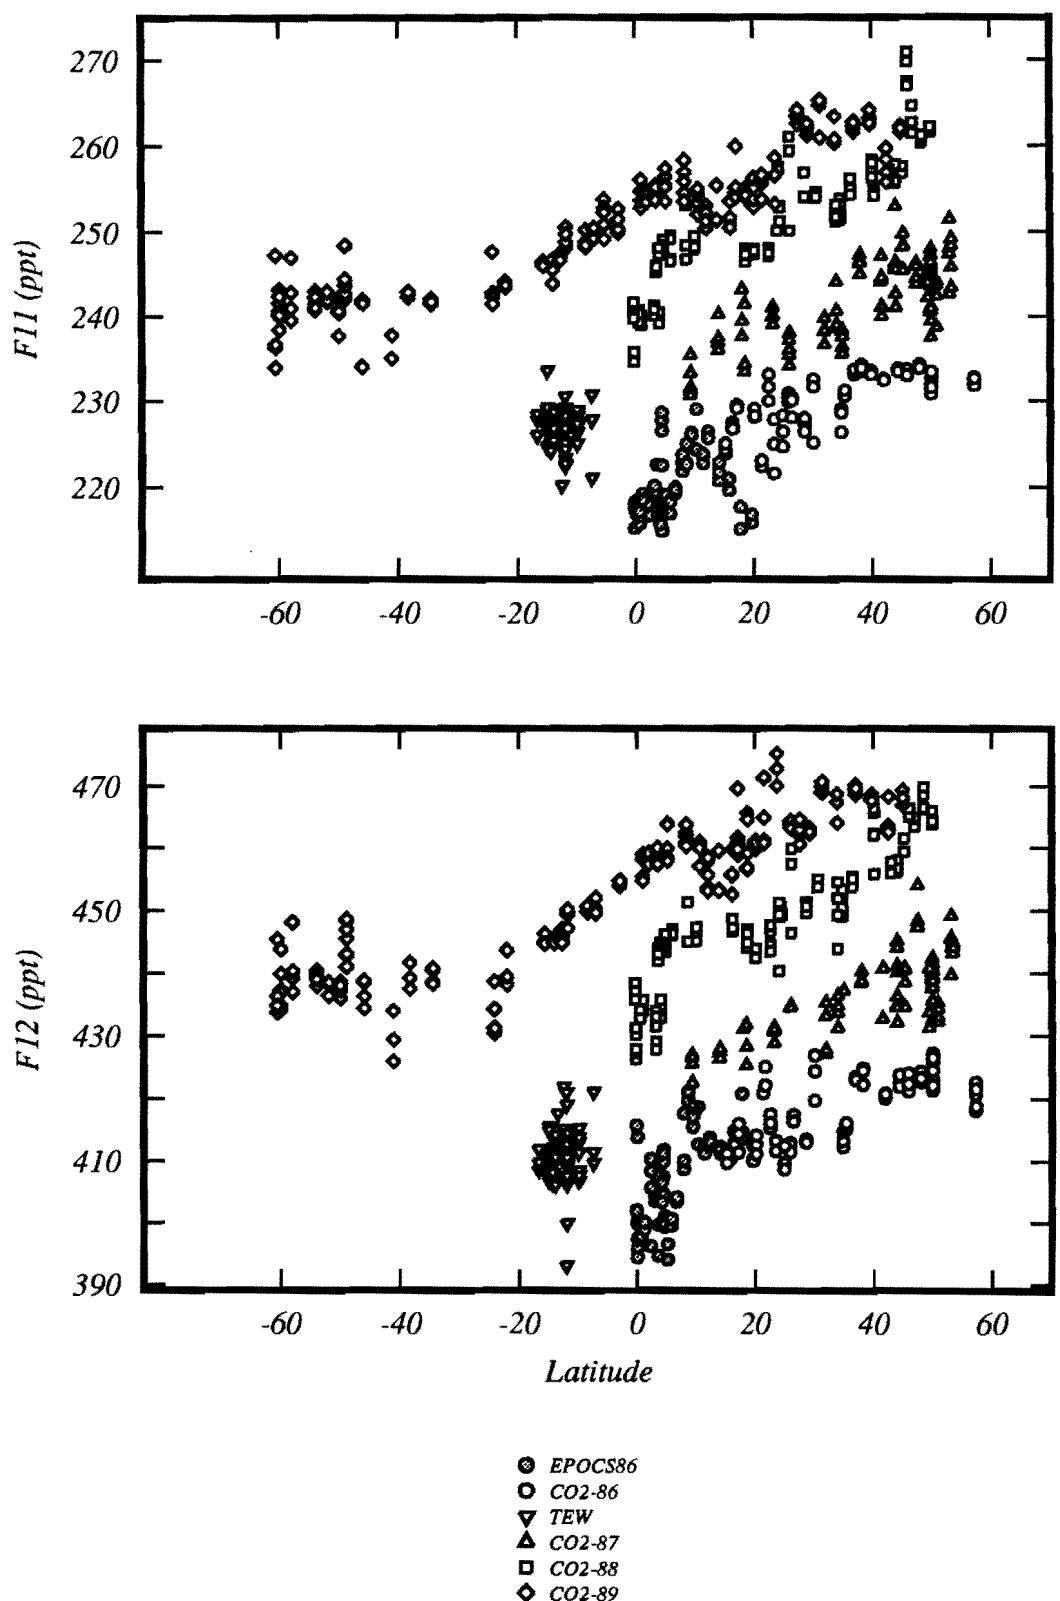

Fig. 4. Atmospheric measurements of CFC-11 and CFC-12 from 1986–1989.

1.9 Estimation of Analytical Precision and Accuracy

Several techniques were used to obtain estimates of analytical precision for seawater samples. Replicate samples were obtained by filling 2 or more syringes with seawater from the same Niskin Bottle, or by closing 2 or more Niskin Bottles at the same depth at a station, and sampling each for CFCs. In some cases, estimates of analytical precision could also be made from analysis of samples collected in a region of near-uniform CFC distribution (e.g., from a set of Niskin bottles closed in the mixed layer, or from a set of Niskin Bottles closed in deep, CFC-free water). The median of the standard deviations for analyses of these types of replicate samples were used to estimate the overall analytical precision.

At most stations, the dissolved CFC concentrations ranged from a high of 1 (or more) pmol/kg in the near surface waters, to near zero concentration in deep waters. In many cases, the analytical precision for a group of samples of varying concentrations can be expressed as either fixed amount (in pmol/kg) or as a percent of sample concentration, whichever is greater. For low concentration samples, typical analytical precisions were of the order of 0.005–0.015 pmol/kg for both CFC-11 and CFC-12. For higher concentration samples, typical precision were of the order of 1–2% for both CFC-11 and CFC-12. Systematic sampling and handling errors are estimated to be of the same order.

A discussion of the replicate samples analyzed and an estimate of analytical precision for the CFCs measurements for each cruise is provided in the cruise description sections below.

1.10 Plotting Techniques

The sections contoured for each cruise follow a few protocols. North is always to the right in latitudinal plots, and east is to the right in longitudinal plots. Stations are listed on the upper axis. Each section begins with a map of the stations used in the contour plots. The gridding and contouring routines are based on those developed by D. Roemmich (Roemmich, 1983) at SIO. All sections are contoured using bottle data only and are intended to provide a coarse overview of the major features present along the section. The temperature and salinity sections do not show the detailed structures apparent in CTD derived sections.

The vertical profile plots of the CFC's were generated using software of R.F. Weiss developed at SIO. Each page consists of five stations and a map of the station locations. Each station is plotted on two scales so that both high and low concentrations may be easily displayed. CFC-11 is represented with circles and CFC-12 with triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis.

2. CRUISE DESCRIPTIONS

2.1 EPOCS-86

The NOAA research vessel *Oceanographer* departed from Panama on 21 May 1986 to begin EPOCS cruise EP2-86-OC. Fifty-five CTD/rosette casts were made at 38 locations in the

equatorial Pacific Ocean. The vessel travelled along the equator from 95°W to 140°W before turning north and docking in Honolulu on 20 June 1986. Transequatorial sections were made at 110°W and 140°W. The processed CTD data from this cruise were reported by Lynch *et al.* (1988).

Atmospheric CFC measurements were made periodically during the cruise. The average concentrations of the measurements south of 4°N are 218.3 PPT and 403.3 PPT. To the north, as the ship approached the ITCZ, the atmospheric concentrations increased.

Dissolved CFC-12 values are not reported for stations 7–9 due to contamination of the sparging chamber on the analytical system. The sample blanks were high during the first ten stations, especially for CFC-12. The blank corrections applied to the seawater measurements are listed below.

EPOCS-86 Sampling blanks

| Station | F11 | F12 |
|---------|--------|-------|
| 1–9 | 0.011 | 0.037 |
| 10–11 | 0.011 | 0.011 |
| 10–38 | 0.0055 | 0.011 |

The estimated precision for measurements of dissolved CFC-11 is $\pm 1.2\%$ or 0.005 pmol/kg, whichever is greater. The estimated precision for CFC-12 is $\pm 2\%$ or 0.02 pmol/kg, whichever is greater for stations 1–9, and 1.5% or 0.01 for stations 10–38. Of the 552 samples analyzed during this cruise, 11 (~2%) of the CFC-11 measurements were flagged, while 82 (nearly 15%) of the CFC-12 values were flagged as anomalous. Most of the flagged CFC-12 data were from the first 10 stations.

EPOCS-86 (EP2-86-OC)

| Name | Institution | Measurement Program |
|------------------|------------------|------------------------------|
| Linda Mangum | NOAA/PMEL | CTD, Chief Scientist |
| Clara Desser | U. of Washington | CTD |
| David Wisegarver | NOAA/PMEL | CFC's |
| Kimberly Kelly | NOAA/PMEL | CFC's, pCO_2 , CH_4 , CO |
| Lee Waterman | GMCC | pCO_2 |
| Donald Barber | Duke | Nutrients |
| Eric Olson | USC | Productivity |

2.2 CO2-86

The NOAA ship *Oceanographer* departed Honolulu on 30 June 1986 en route to Kodiak, Alaska. Sixty-two CTD/rosette casts were made at 18 stations in the eastern North Pacific (nominally along 135°W), eight of which were stations previously sampled in July 1981.

Atmospheric measurements were usually made in groups of 3 to 5 analyses, over a period of less than 1 hour. The precision of the measurements made in these groups was typically 0.5%–1.0% for CFC-11 and CFC-12, respectively. The averages of the northern hemispheric measurements made during this cruise were 230.0 ± 3.2 PPT and 417.9 ± 4.8 PPT for CFC-11 and CFC-12.

Due to problems with the primary winch, deep casts were only possible at Stations 1 and 2. Casts for all other stations were limited to depths less than 2100 meters. Ten-liter and thirty-liter General Oceanics Niskin bottles were used for collection of discrete water samples; however, CFC's were drawn from 10-liter bottles only. A value of 50 has been added to the 30-liter Niskin bottle number for identification purposes. Therefore, any bottle number that is 51 or greater, refers to a 30-liter bottle. The number which identifies each sample consists of the cast number multiplied times 100 plus the bottle number. A sample identification number with a digit greater than 4 in the "ten's column" indicates that it was drawn from a 30-liter bottle.

The sampling blanks were determined from the median value of samples drawn from water with $\sigma_0 > 27.1$. The F12 sampling blank for the first station was 0.019. Thereafter, the blank subtracted was 0.009, while 0.005 was subtracted from all F11 concentrations.

CO2-86 Sampling blanks

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 1 | 0.005 | 0.019 |
| 2-18 | 0.005 | 0.009 |

The precision of the measurements based on replicate analyses was the greater of 1.2% or 0.005 pmole/kg for CFC-11 and 1% or 0.005 pmole/kg for CFC-12.

Of the 530 samples analyzed for CFC's during this cruise, 17 CFC-11 (3%) measurements and 37 CFC-12 (7%) measurements were flagged as flyers.

2.3 TEW

The *Oceanographer* departed Tahiti on 6 June 1987 en route to Townsville, Australia. The cruise track for Leg 2 started westward along 12°S. A diversion was made to the Samoan Passage (10°S) before continuing westward along 15°S. During Leg 2 a total of 109 casts were made. During Leg 3 the ship moved through the Coral sea, on to 5°S, 165°E and north along 165°E to Kwajalein, completing 42 casts.

CFC's were not measured at every station and only those stations where CFC's were measured will be reported here. The CTD and hydrographic data were reported by Mangum *et al.* (1991).

Atmospheric measurements were made periodically during the cruise. The average of southern hemisphere measurements for the two CFC's are 226.9 PPT and 411.2 PPT for CFC-11 and CFC-12, respectively.

The Niskin bottles used during this cruise were newly purchased and may have caused higher than normal blank problems for some samples. The sampling blanks for Legs 2 and 3 are shown below. The cast numbers for Leg 3 have had 200 added to them so that each cast made during the TEW cruise has a unique number to identify it.

TEW sampling blanks Legs 2 and 3

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 1-4 | 0.005 | 0.006 |
| 5-7 | 0.008 | 0.006 |
| 8 | 0.007 | 0.022 |
| 9-10 | 0.001 | 0.009 |
| 11-20 | 0.004 | 0.009 |
| 21-23 | 0.006 | 0.004 |
| 24 | 0.006 | 0.009 |
| 25-27 | 0.006 | 0.007 |
| 28 | 0.006 | 0.000 |
| 29-34 | 0.006 | 0.005 |
| 35 | 0.011 | -0.002 |

TEW sampling blanks Legs 2 and 3 (cont.)

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 36-37 | 0.005 | 0.006 |
| 38-39 | 0.005 | 0.013 |
| 40-48 | 0.005 | 0.010 |
| 49-51 | 0.000 | 0.020 |
| 52-60 | 0.002 | 0.003 |
| 61-67 | 0.002 | 0.008 |
| 68-84 | 0.004 | 0.001 |
| 85-109 | 0.006 | 0.006 |
| 201-222 | 0.006 | 0.004 |
| 223-242 | 0.003 | 0.002 |

The precision for both CFC-11 and CFC-12 is estimated to be 1% or 0.005 pmol/kg, whichever is greater. Of the 1164 samples analyzed during the cruise, 19 (2%) data points were flagged for CFC-11 and 72 (6%) for CFC-12.

2.4 CO2-87

Seventy-two casts were made at 32 stations along 165°E and 50°N during August 1987. Ten of the stations were previously occupied by PMEL in 1982. The *Oceanographer* left Kwajalein on July 30 heading for the first station at 10°N 165°E. The vessel ran north along 165°E to 50°N. Eight stations were occupied along 50°N before landing in Seattle on 28 August 1987.

The average of the atmospheric measurements made in the northern hemisphere are 242.7 ± 4.3 PPT for CFC-11 and 436.6 ± 5.6 PPT for CFC-12.

Oxygen is not reported for stations 2-5 due to analytical problems.

During the cruise, the Autosal salinometer malfunctioned and showed substantial drift. Due to this problem, all salinities reported for this cruise are from the CTD. With few exceptions, the bottle salinities were used only as guides for determining mistrips and leaks.

Sampling blanks were determined from the median value of water sampled which had a σ_0 greater than 27.1. The median values, subtracted from all measurements, were 0.004 for F11 and 0.006 for F12.

CO2-87 Sampling blanks

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 1-32 | 0.004 | 0.006 |

The precision of the analyses during this cruise, based on replicate measurements, mixed layer measurements and blank levels is the greater of 1% or 0.005 for both gases. Of the 1071 samples analyzed during this cruise, 16 (1.5%) CFC-11 results were flagged and 35 (3%) CFC-12 measurements were flagged as flyers.

| Glenn Smith | IOS | pCO ₂ |

Nutrient samples were collected, frozen and analyzed at the Univ. of Washington

2.5 CO2-88

The *Discoverer* departed Dutch Harbor on 5 April 1988 heading for 50°N 170°W to begin the transect along 170°W. Ninety casts were made at 35 stations before landing in Pago Pago, American Samoa on 4 May. This section was a reoccupation of a 1983 PMEL section. Atmospheric measurements were made throughout the cruise. The averages of the northern

hemisphere measurements (average of all measurements north of 5°N) were 254.4 ± 1.0 PPT and 453.6 ± 1.5 PPT for F11 and F12. The precision of each group of measurements was typically 0.5%–1% for both gases.

Sample handling blanks varied through the cruise, and are listed below. The sampling blanks were determined from the median values of groups of stations with similar blank levels.

CO2-88 Sampling blanks

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 1–12 | 0.004 | 0.006 |
| 13 | 0.009 | 0.006 |
| 14–17 | 0.009 | 0.010 |
| 18–20 | 0.002 | 0.010 |
| 21–35 | 0.008 | 0.002 |

The precision of the measurements, for both gases, is estimated to be 1% or 0.005, whichever is greater. Of the 1030 samples measured, 19 (2%) of the CFC-11 measurements were flagged and 54 (5%) of the CFC-12 measurements were flagged as flyers.

Nutrient samples were collected, frozen and analyzed at the University of Washington.

2.6 CO2-89

The first leg of the RITS/CO2-89 cruise (RITS-89-DI) aboard the NOAA ship *Discoverer* was used as an opportunity to test new equipment en route to the work area. No data from this leg is included in this report. Leg 2 began with the ship's departure from Manzanillo, Mexico on 15 February 1989. The ship ran along 105°W to Easter Island, on to 60°S and north to Tahiti.

The ship returned to Seattle from Tahiti with only three stops for stations, although atmospheric measurements were made periodically throughout the voyage. Eighty-seven CTD/rosette casts were made at 51 stations in the eastern tropical and southeastern Pacific Ocean during this cruise.

Atmospheric measurements were frequently hampered by contamination of the air sampling tube with ship's air. A narrow range of relative wind direction and speed was used to remove spurious results. The average of the atmospheric measurements made north of 10°N were 257 ± 4.2 PPT and 463 ± 3.9 PPT for F11 and F12. The average of the measurements made south of 10°S were 242 ± 2.8 PPT and 439 ± 4.5 PPT. Individual groups of measurements had standard deviations on the order of 0.5% to 1%.

The analytical techniques used to measure the CFC's during this cruise were similar to the earlier cruises, except that the ECD signal was processed on an HP 3396 integrator and the chromatograms stored on floppy diskettes. Upon return to the laboratory, the chromatograms were rerun on the HP3396 integrator and the signal restored using the Chromperfect integration software package (Justice Innovations, Inc.). Each peak was expanded on the computer screen and reintegrated using Chromperfect. The reintegrated areas were assimilated with the analytical parameters necessary for processing the measurements using software developed by D. Lee (PMEL).

The water sampling bottles used during this cruise were new, untested bottles which had little opportunity to "age". Consequently, the samples were contaminated with a significant CFC signal, especially during the early stages of the cruise. The water measurements made during Leg 4 were used for testing analytical methods and are not reported here.

The sampling blanks were determined from the median value of samples drawn from water with $\sigma_0 > 27.4$ at stations north of any expected CFC intrusion into the denser waters. Sampling blanks for CFC-12 varied from a high at Station 1 of 0.036 to under 0.01 towards the end of the cruise. CFC-11 blanks were somewhat less variable but also elevated at the beginning of the cruise. The blanks subtracted from the measurements are listed below.

CO2-89 Sampling blanks

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 4 | 0.013 | 0.027 |
| 5 | 0.013 | 0.014 |
| 6 | 0.013 | 0.021 |
| 7 | 0.013 | 0.026 |
| 8-10 | 0.013 | 0.020 |
| 11 | 0.010 | 0.005 |
| 12-13 | 0.010 | 0.019 |
| 14 | 0.010 | 0.015 |
| 15 | 0.018 | 0.015 |
| 16 | 0.010 | 0.010 |
| 17 | 0.010 | 0.020 |
| 18 | 0.010 | 0.014 |

CO2-89 Sampling blanks (cont.)

| Station | CFC-11 | CFC-12 |
|---------|--------|--------|
| 19 | 0.010 | 0.024 |
| 20-25 | 0.008 | 0.010 |
| 26 | 0.008 | 0.017 |
| 27 | 0.008 | 0.010 |
| 28-29 | 0.008 | 0.015 |
| 30-43 | 0.008 | 0.009 |
| 44 | 0.008 | 0.006 |
| 45-48 | 0.006 | 0.006 |

The precision of the measurements, based on replicate analyses, was the greater of 1.2% or 0.005 pmole/kg for CFC-11 and 1.5% or 0.01 pmole/kg for CFC-12 except where sampling blanks are significantly higher. Of the 1540 samples analyzed during this cruise, 52 (3%) of the CFC-11 measurements and 79 (5%) of the CFC-12 measurements were flagged as flyers.

3. ACKNOWLEDGMENTS

We thank Dr. R.F. Weiss and P. Salameh for access to the software developed at SIO for CFC data processing and data display. We thank Dr. R. Rasmussen for providing us with the calibration gas used during the 1986 cruise, Dr. P. Steel for filling our standard gas cylinders with compressed air at Niwot Ridge, and Drs. M. Warner and R.F. Weiss for calibrating our standards used during the 1987-1989 field seasons. We thank L. Mangum, J. Lynch, L. Stratton and K. McTaggart for CTD data acquisition and processing and Ryan Whitney for preparing the report for publication. We thank the officers and crews of the NOAA ships *Oceanographer* and

Discoverer, especially the survey technicians who assisted in the data collection. We thank CST R. Buendia, CST L. Murray and SST S. Bell for analyzing salinity samples. This work was supported by NOAA's Air Resources Laboratory and NOAA's Climate and Global Change Program.

5. CRUISE DATA

5.1. EPOCS-86 (EP2-86-OC)

This section includes the following data collected during the EPOCS86 cruise (21 May to 20 June, 1986).

- 1) Station location plot.
- 2) Station location and bottom depth listing.
- 3) CFC atmospheric measurement listings.
- 4) Contoured sections of Potential Temperature, Salinity, CFC-11 and CFC-12 along the equator from 95° W to 140° W^o, across the equator at 110° W and across the equator at 140° W, derived from bottle data.
- 5) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 6) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Only the upper 800 meters of data are displayed as the CFC signal is below detection limits in deeper water. Any station which has no CFC data in the range 0–800 meters will appear as a blank box. Units are in picomoles per kilogram.

Potential Temperature and Salinity during EPOCS86 Along the Equator.
Station numbers are indicated across the top. East is to the right.

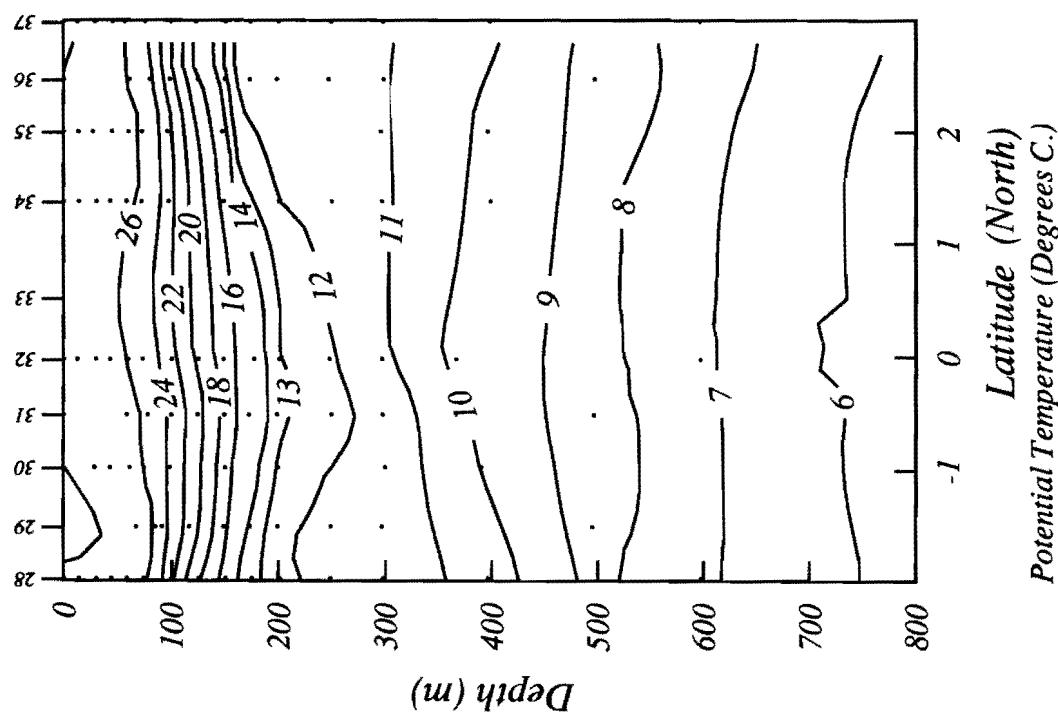

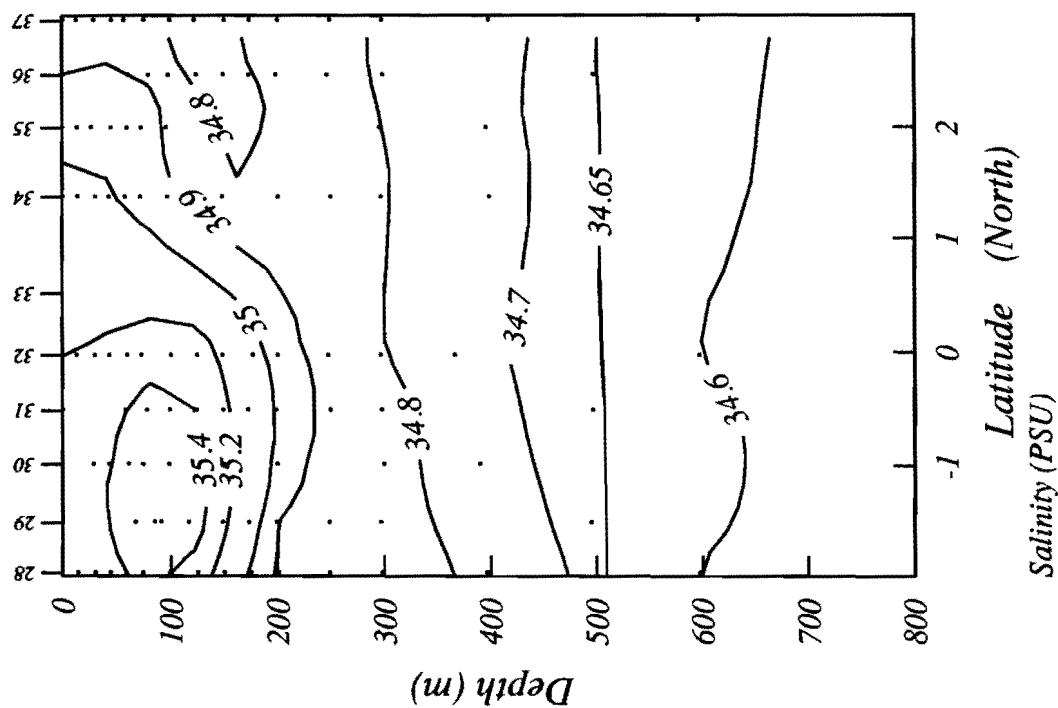

*CFC-11 and CFC-12 during EPOCS86 Along the Equator.
Station numbers are indicated across the top. East is to the right.*

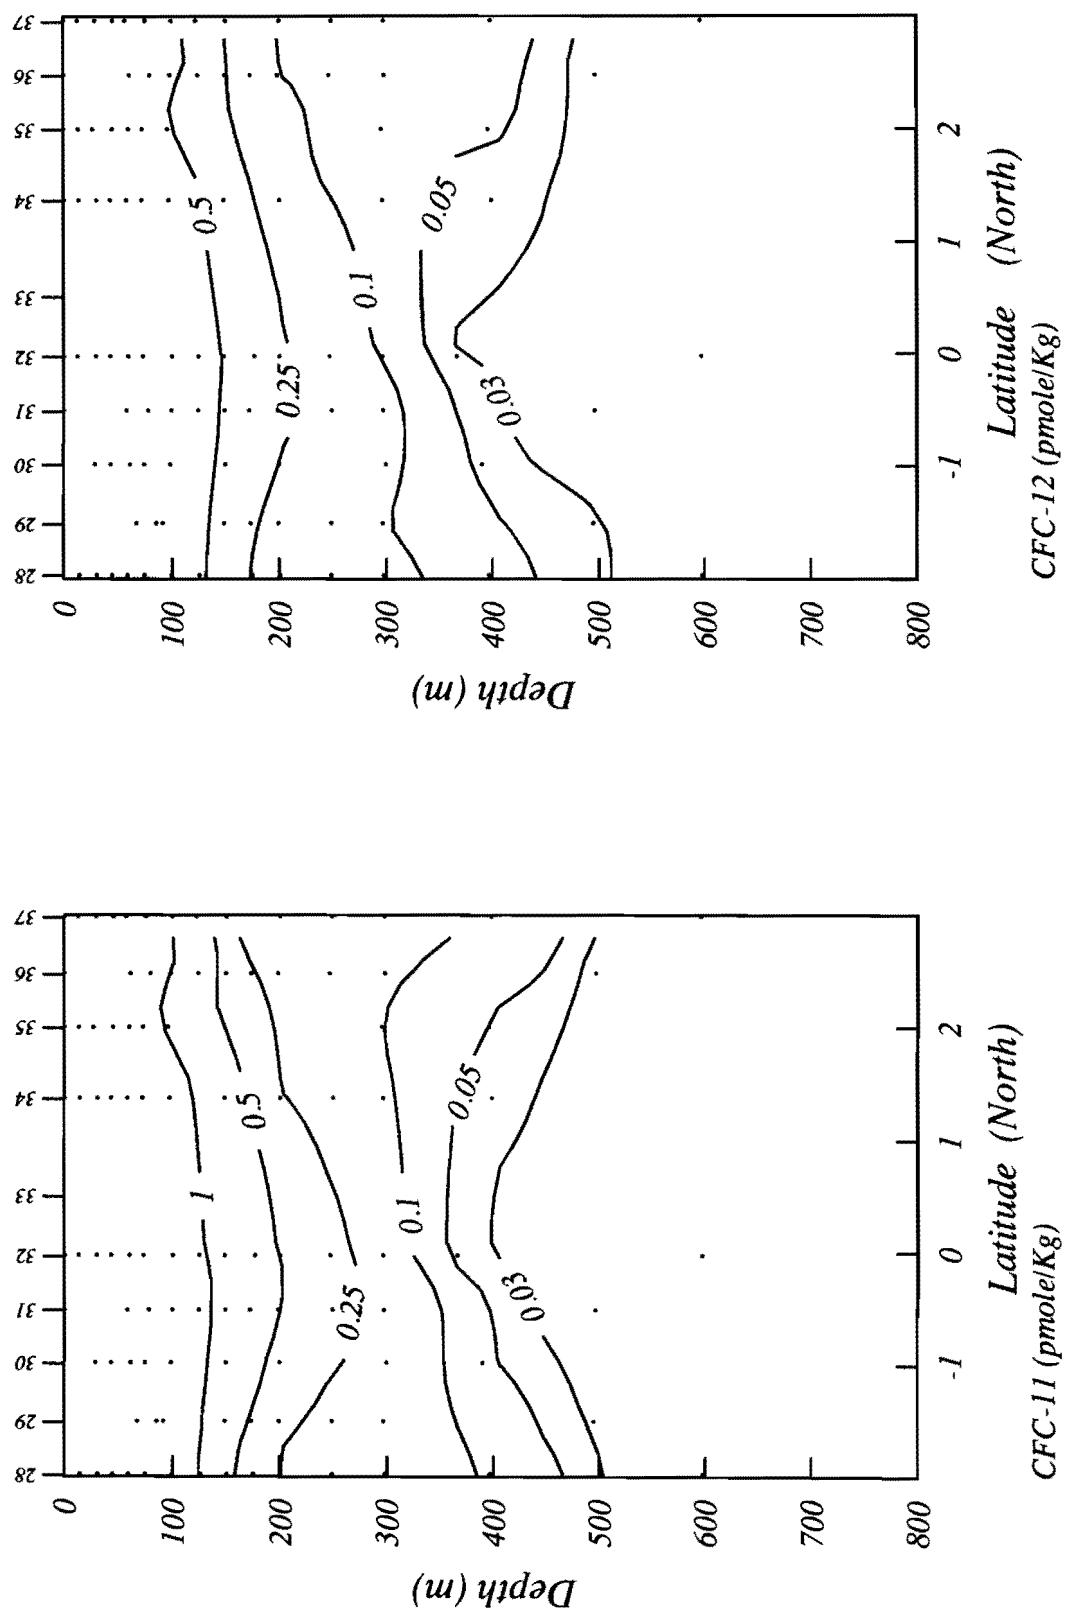

*Potential Temperature and Salinity sections along 110 West during EPOCS86.
Station numbers are indicated across the top.*

*CFC-11 and CFC-12 sections along 110 West during EPOCS86.
Station numbers are indicated across the top.*

Potential Temperature and Salinity sections along 140° West during EPOCS86.
Station numbers are indicated across the top.

CFC-11 and CFC-12 sections along 140°W during EPOCS86.
Station numbers are indicated across the top.

5.2 CO2-86 (RPI-OC-86)

This section includes the following data collected during the CO2-86 cruise (30 June to 22 July, 1986).

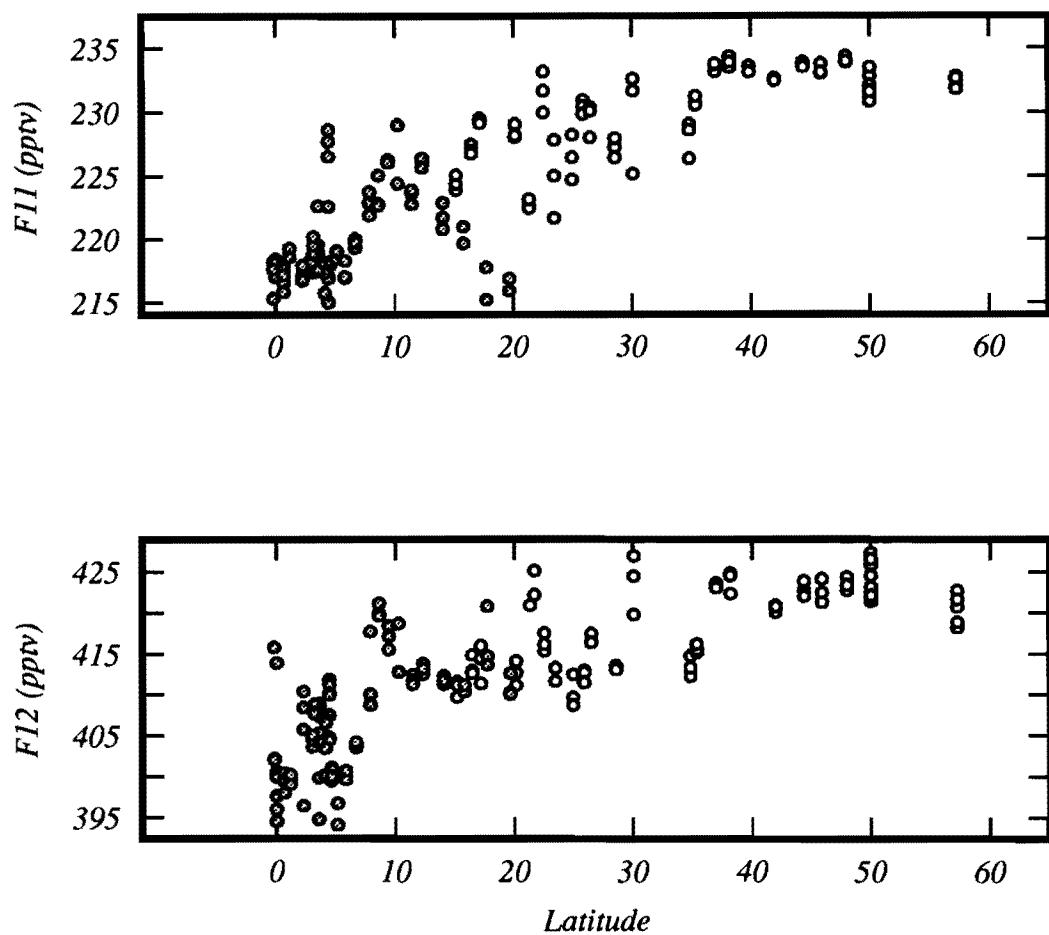

- 1) Station location plot.
- 2) Station location and bottom depth listing.
- 3) CFC atmospheric measurement plot.
- 4) CFC atmospheric measurement listing.
- 5) Contoured sections of Potential Temperature, Salinity, Oxygen, CFC-11 and CFC-12 along 135° W from 15° N. to 56° N, derived from bottle data.
- 6) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 7) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Only the upper 1500 meters of data are displayed as the CFC signal is below detection limits in deeper water. Any station which has no CFC data in the range 0–1500 meters will appear as a blank box. Units are in picomoles per kilogram.

*CO2-86 Station Locations.
R/V OCEANOGRAPHER
30 June - 22 July, 1986
Honolulu, Hawaii - Kodiak, Alaska*

Atmospheric Measurements during the EPOCS86 and CO2-86 cruises. The average of the northern hemisphere concentrations of the two CFC's are 230.0 and 417.9 for CFC-11 and CFC-12, respectively.

5.3 TEW (TW2-87-OC; TW3-87-OC)

This section includes the following data collected during the TEW cruise (6 June to 22 July, 1987).

- 1) Station location plot.
- 2) Station location and bottom depth listing. For Leg 3, the station identifier is 200 plus the station number.
- 3) CFC atmospheric measurement listing.
- 4) Contoured sections of Potential Temperature, Salinity, Oxygen, CFC-11 and CFC-12 along 12-15° S from Tahiti to Australia and the transect of the Coral Sea, derived from bottle data.
- 5) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Only stations with CFC data will be presented. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 6) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Only the upper 1500 meters of data are displayed as the CFC signal is below detection limits in deeper water. Any station which has no CFC data in the range 0-1500 meters will appear as a blank box. Units are in picomoles per kilogram.

TEW Station Locations.
R/V OCEANOGRAPHER
Leg 2. 6 June-5 July, 1987
Papeete, Tahiti - Townsville, Australia
Leg 3. 12 July-22 July, 1987
Townsville, Australia - Kwajalein, Marshall Islands

*Potential Temperature section along 12-15 South during the TEW Cruise
 Station numbers are indicated across the top.*

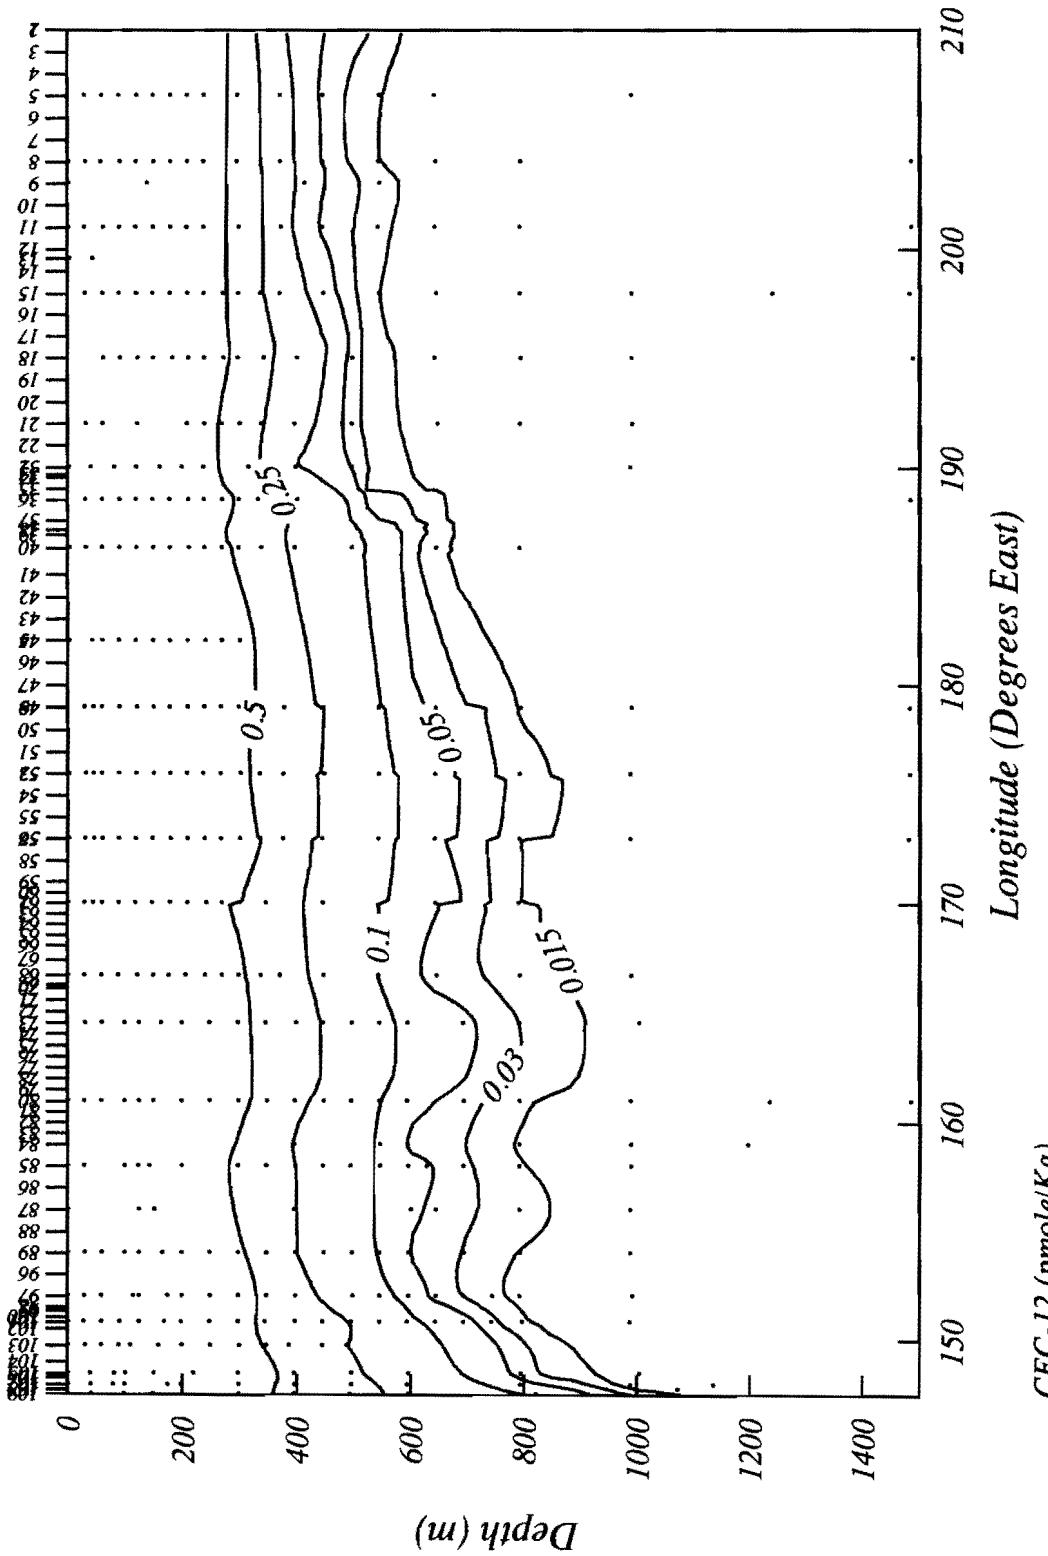

Salinity section along 12-15°S during the TEW Cruise
Station numbers are indicated across the top.

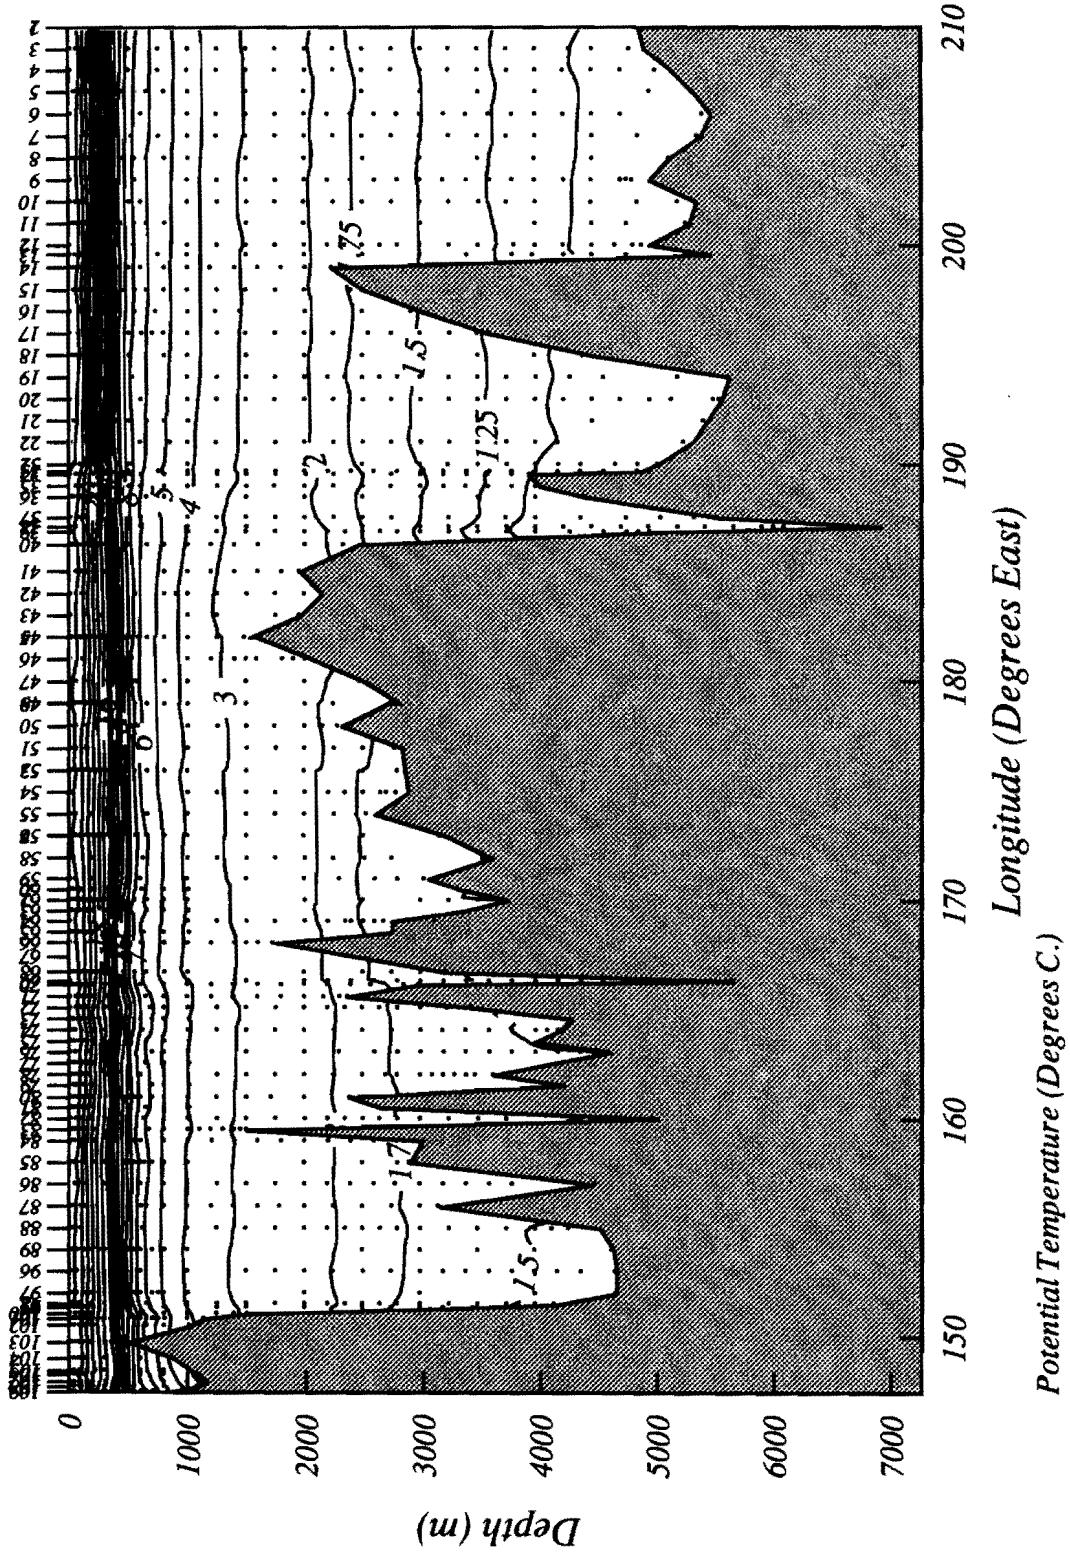

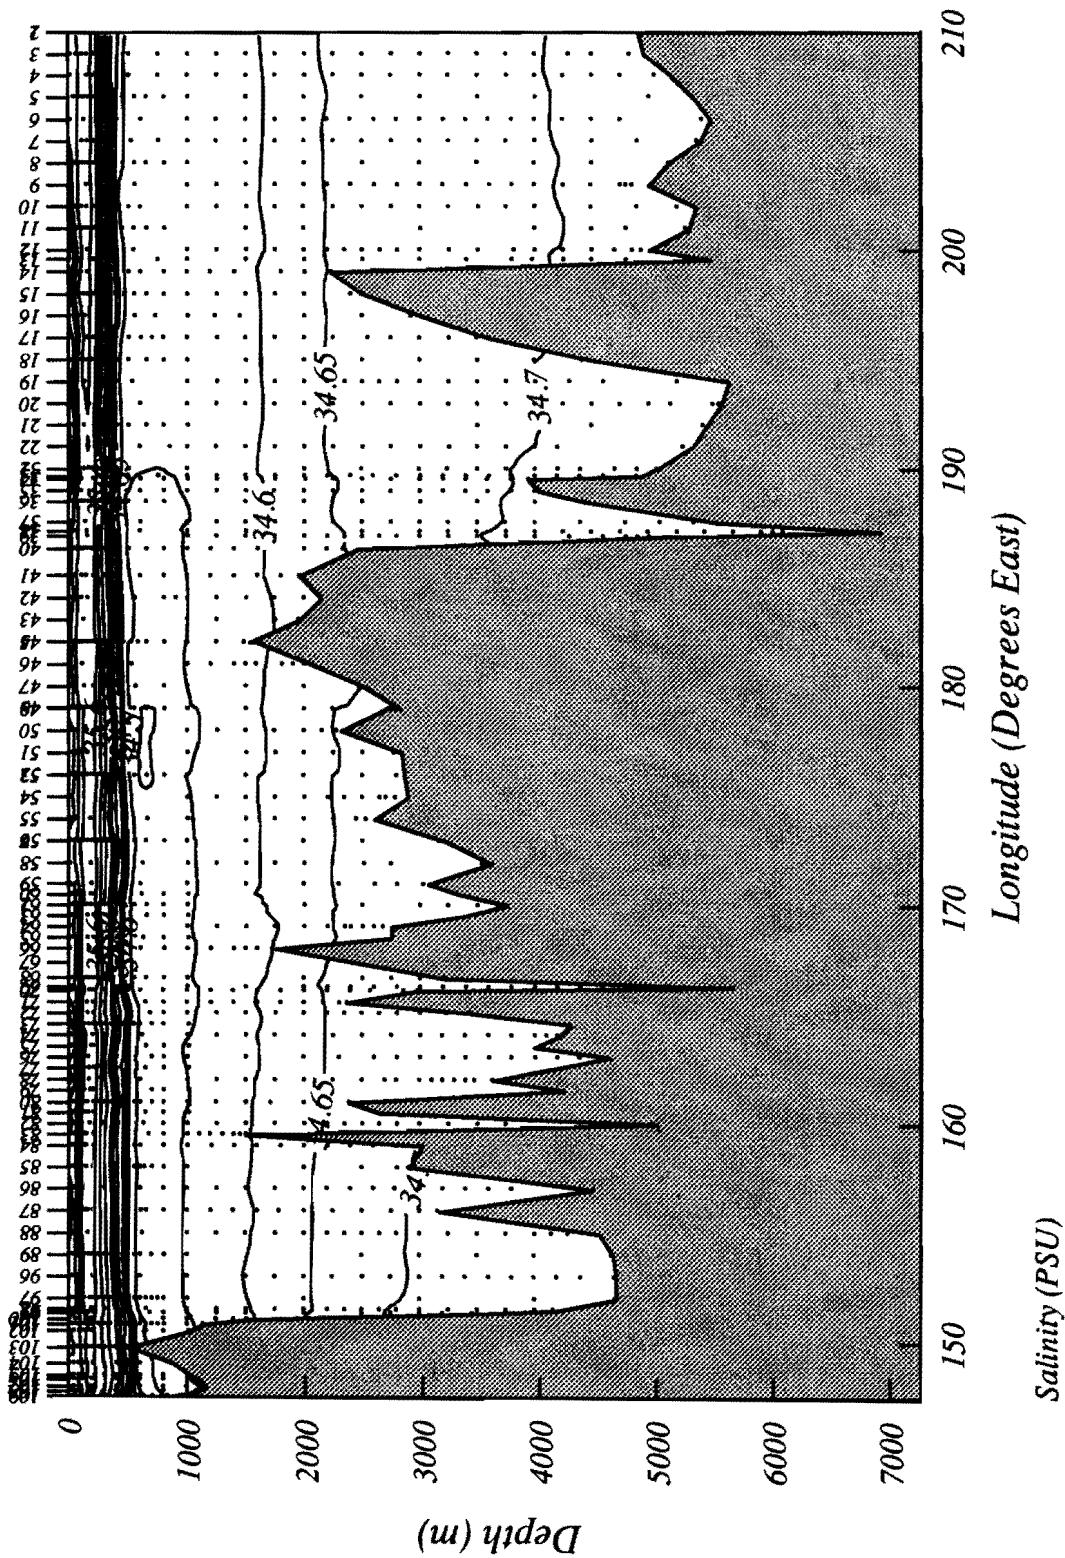

CFC-11 section along 12-15 South during the TEW Cruise
Station numbers are indicated across the top.

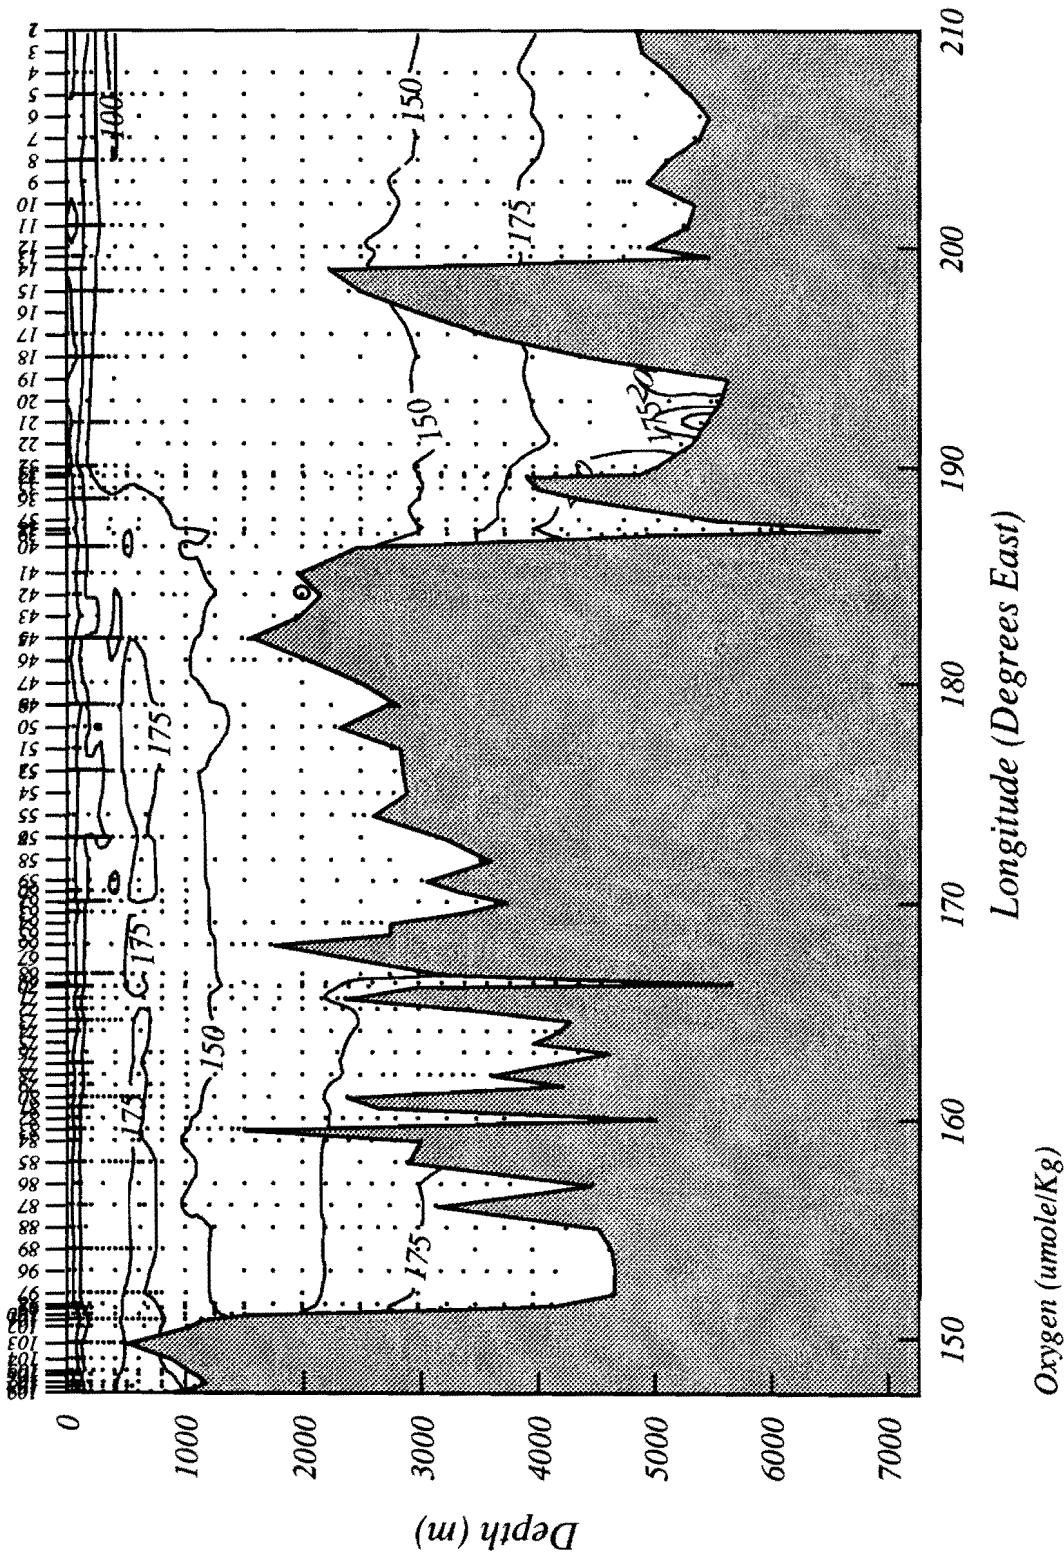

CFC-12 section along 12-15 South during the TEW Cruise
Station numbers are indicated across the top.

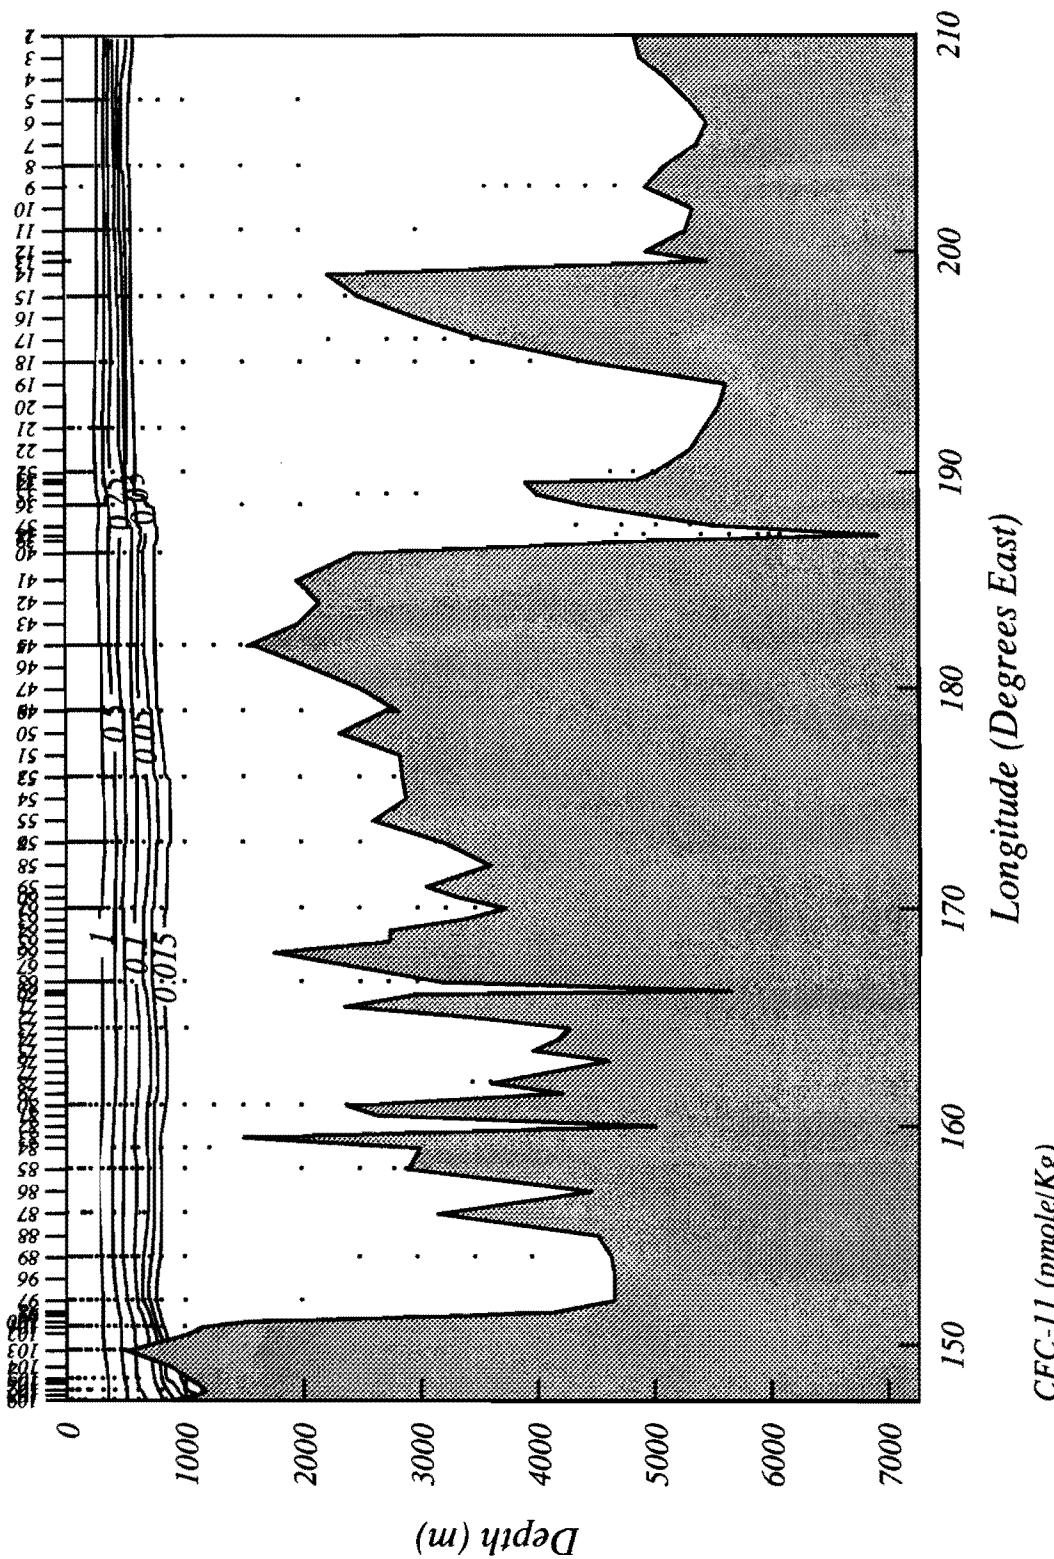

*Potential Temperature section along 12-15°S during the TEW Cruise
 Station numbers are indicated across the top.*

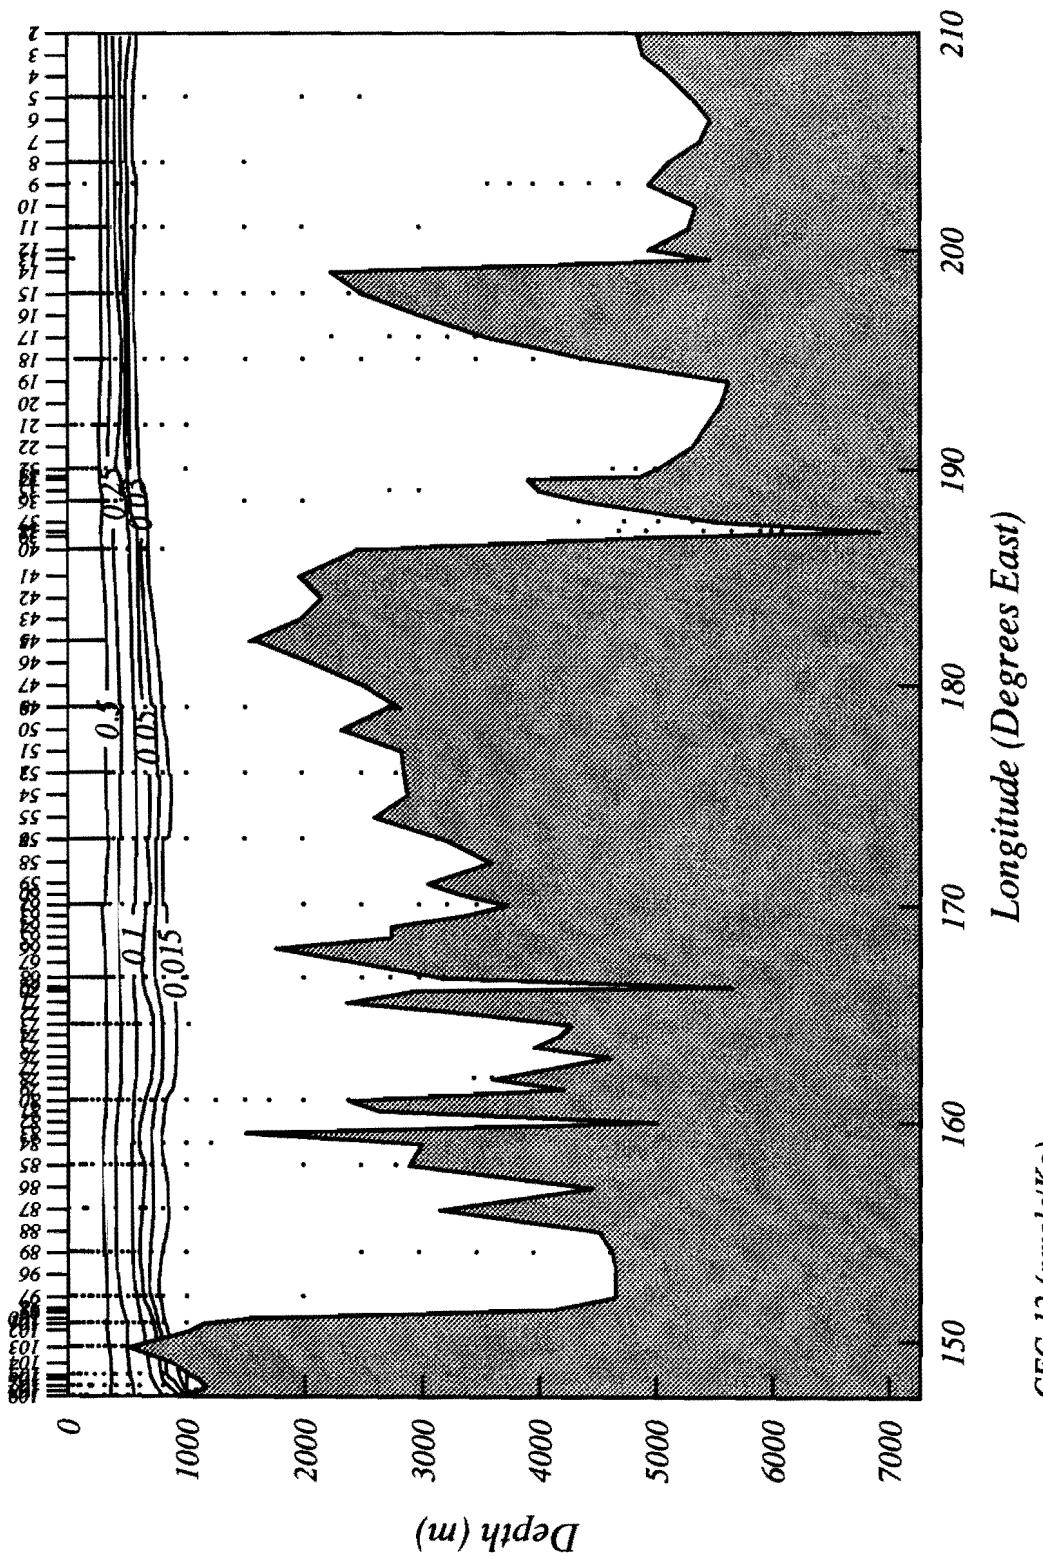

*Salinity section along 12-15 South during the TEW Cruise
Station numbers are indicated across the top*

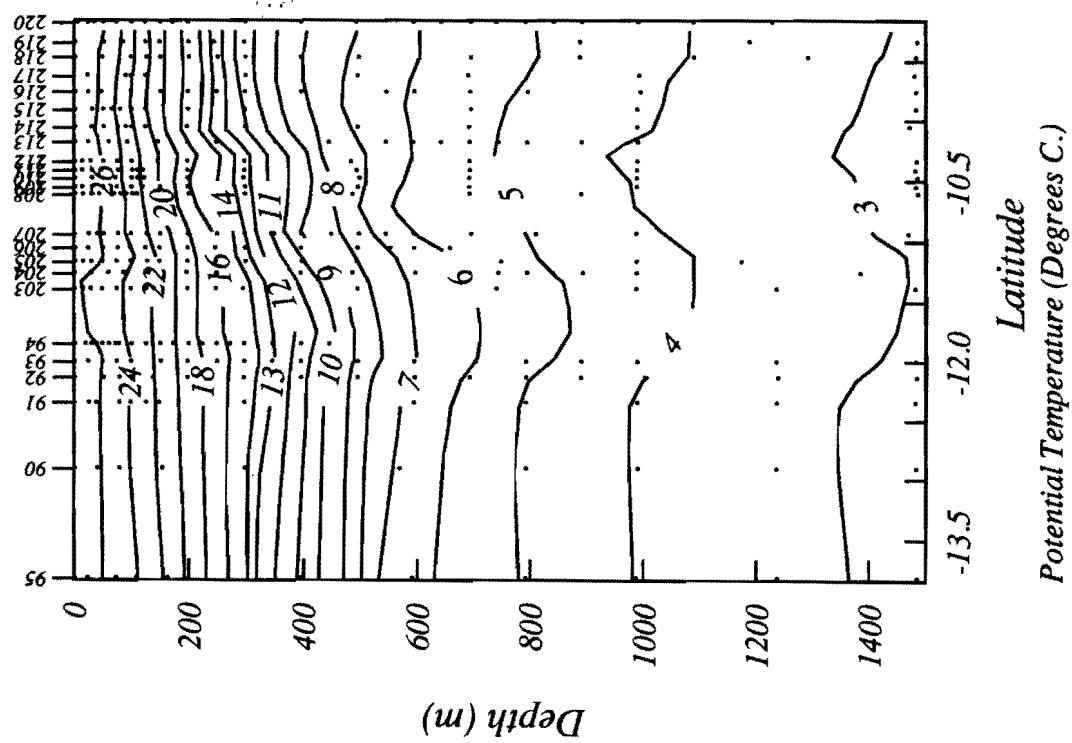

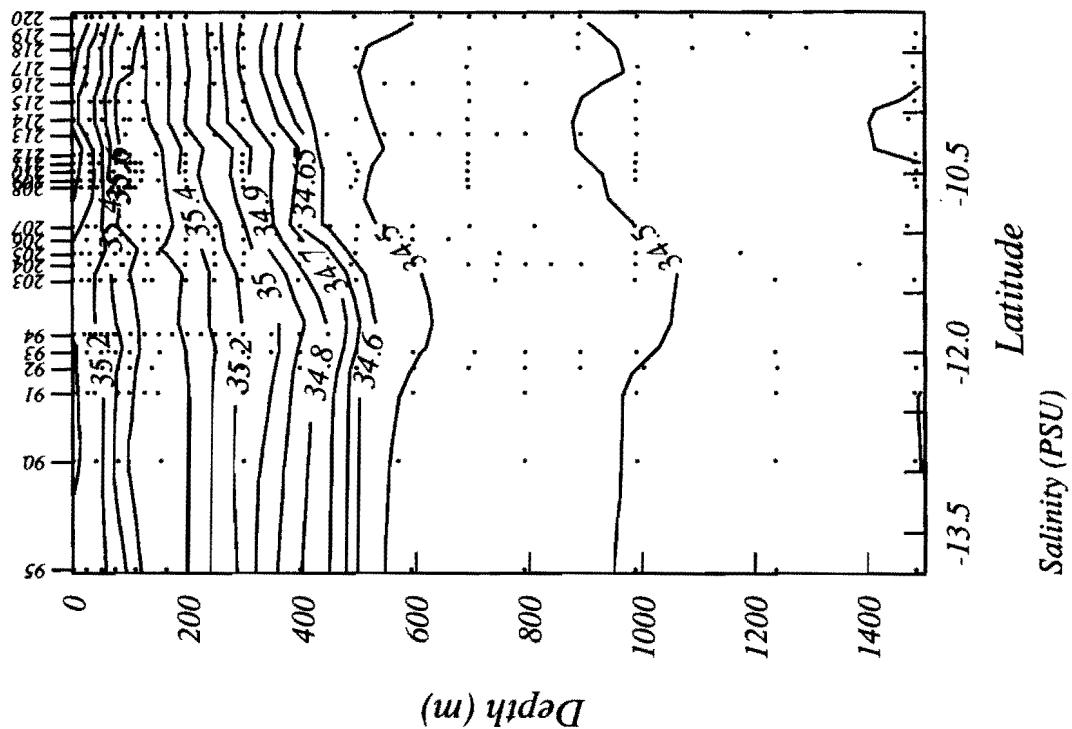

*Dissolved Oxygen section along 12-15° South during the TEW Cruise
Station numbers are indicated across the top.*

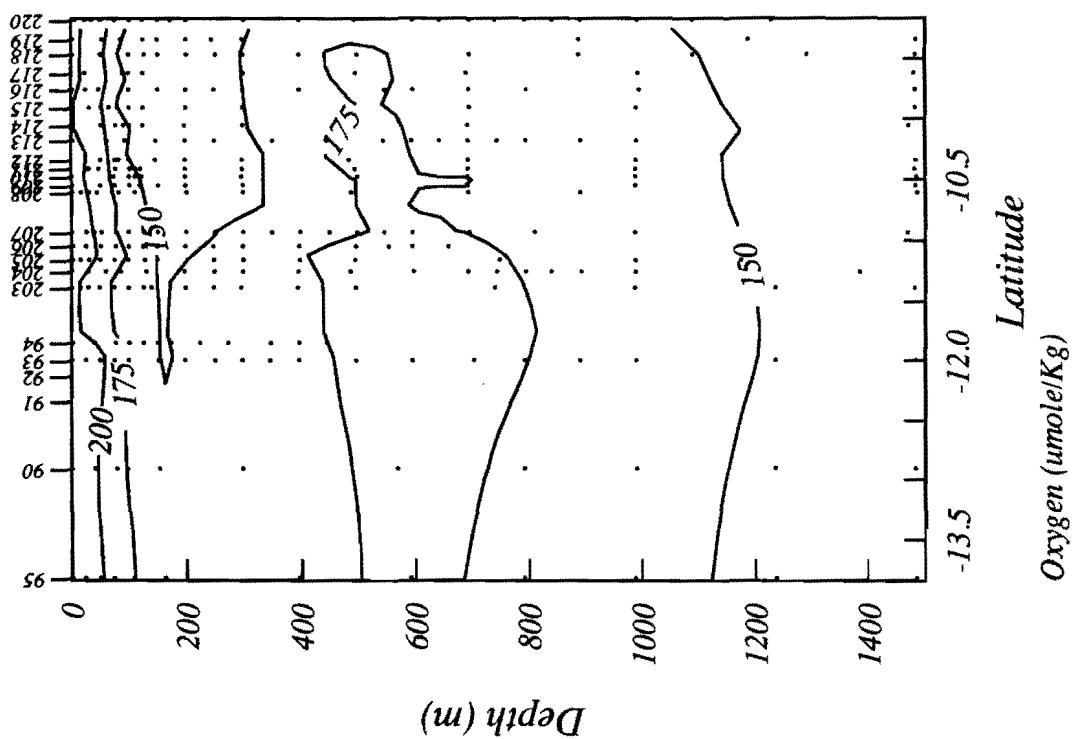

*CFC-11 section along 12-15 South during the TEW Cruise
 Station numbers are indicated across the top.*

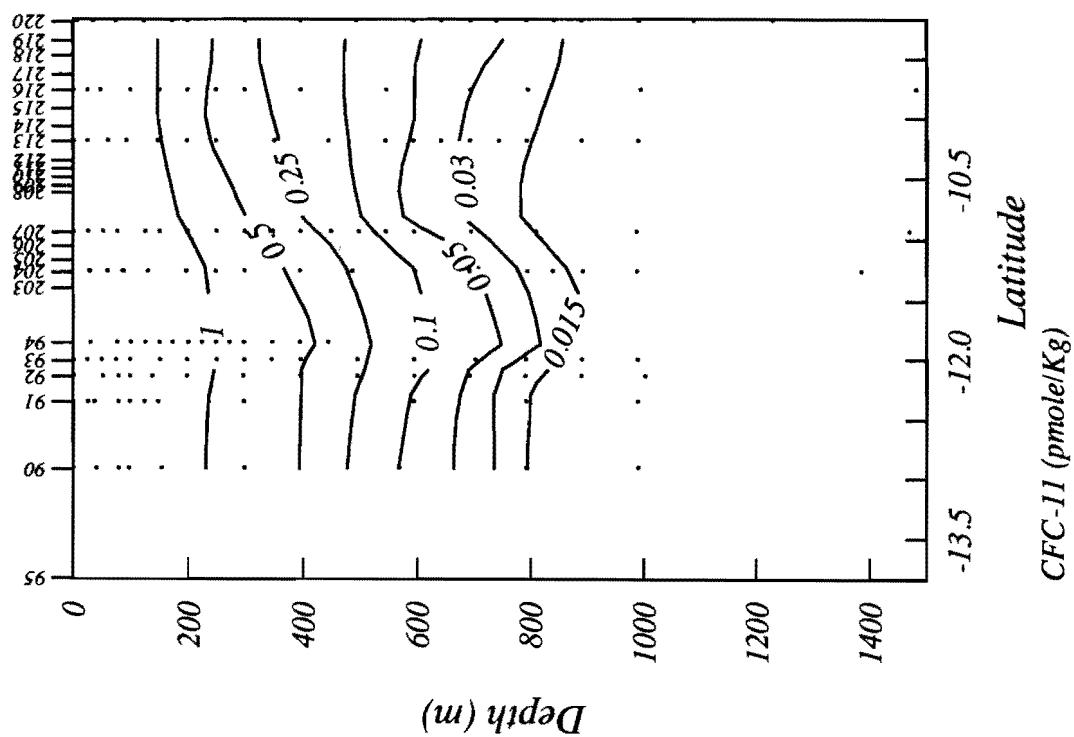

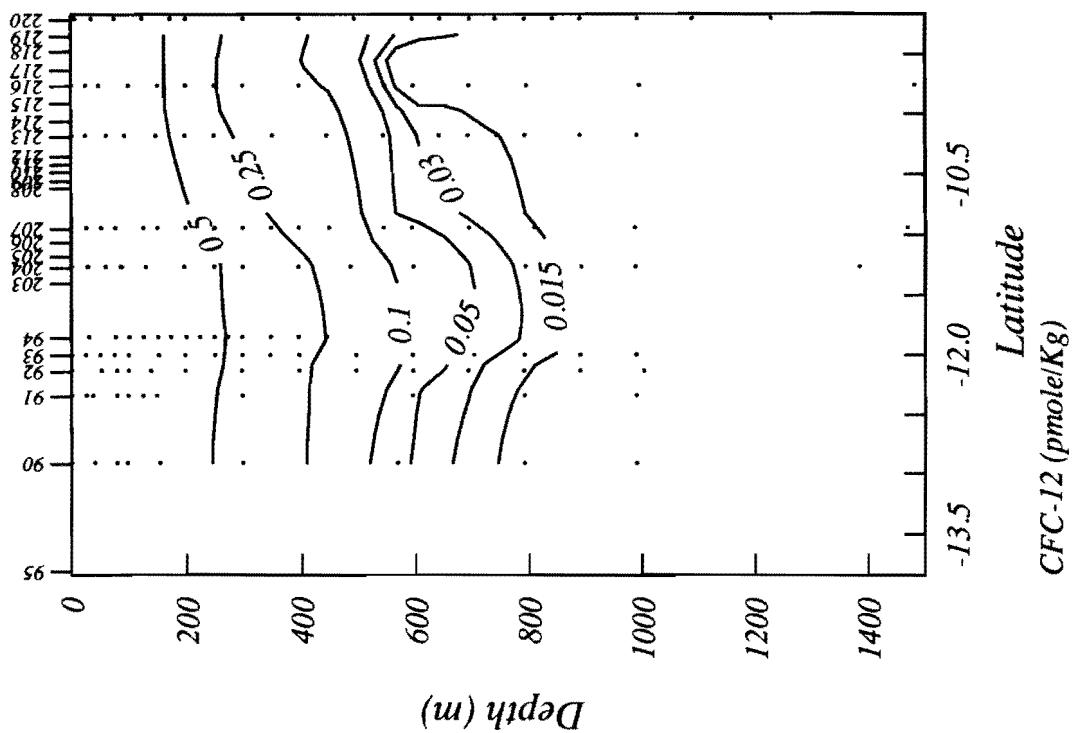

*CFC-12 section along 12-15°S during the TEW Cruise
 Station numbers are indicated across the top.*

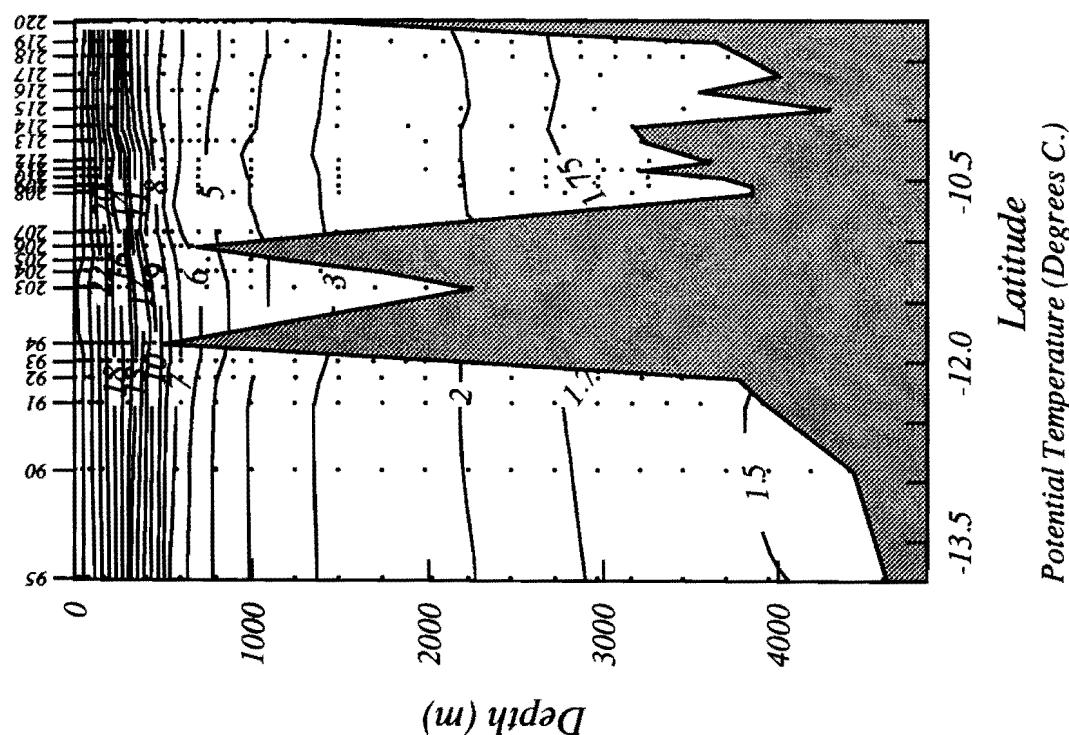

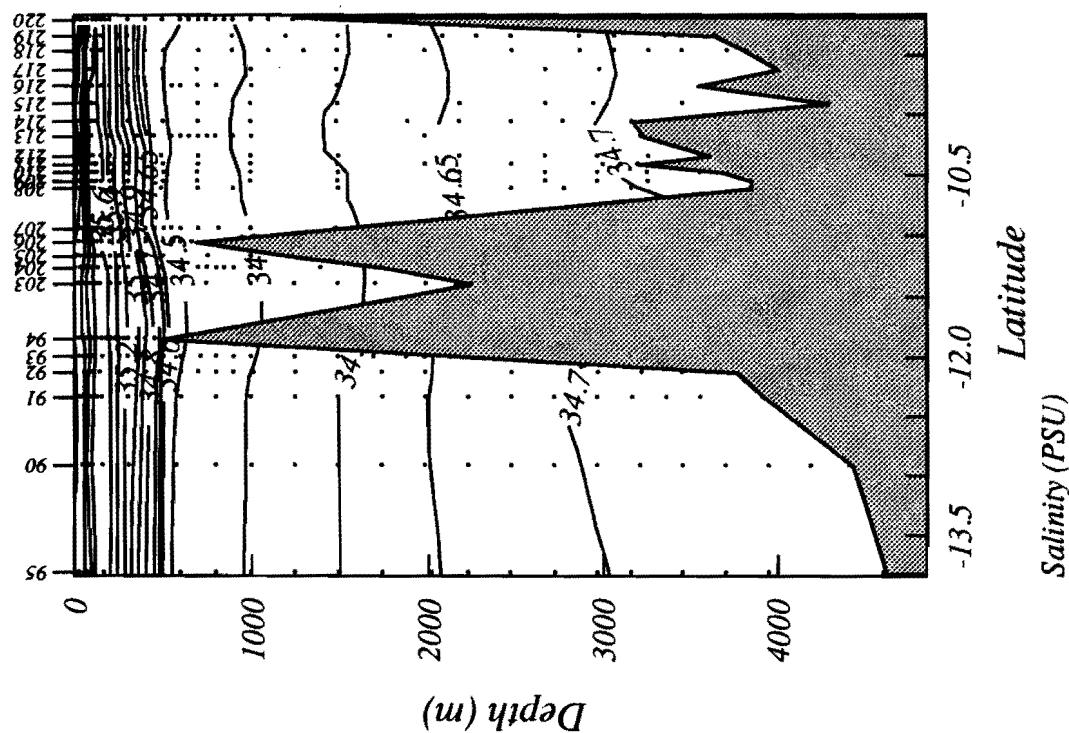

*Potential Temperature and Salinity sections across the Coral Sea during TEW.
Station numbers are indicated across the top.*

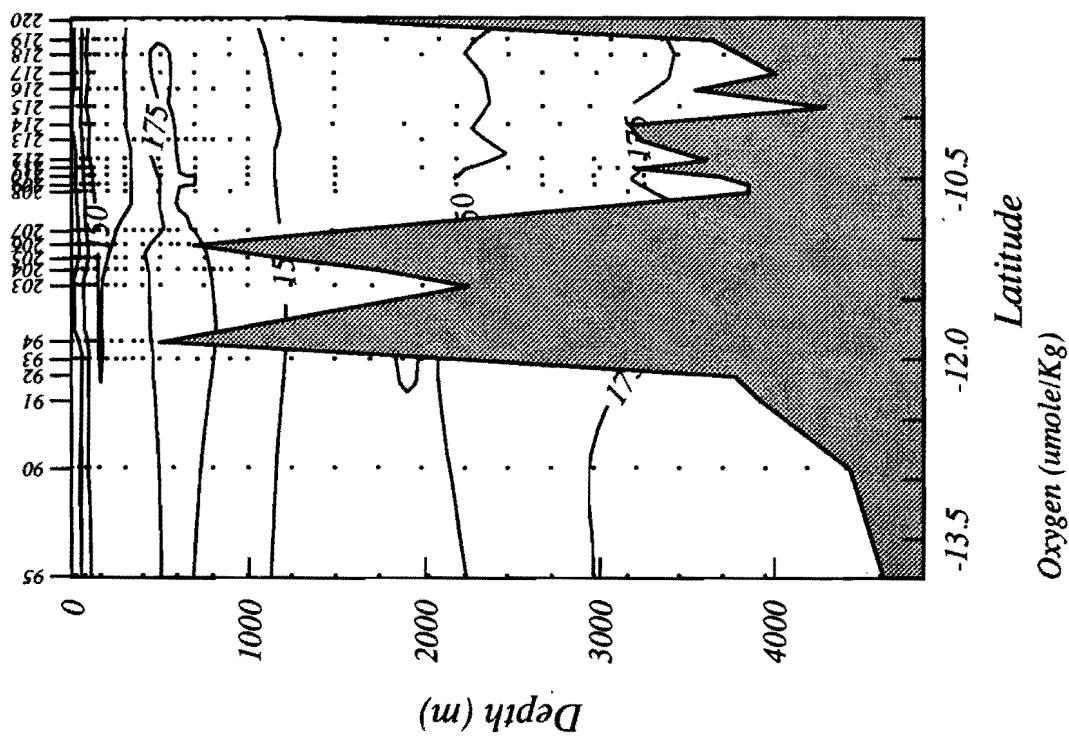

*Dissolved Oxygen section across the Coral Sea during TEW.
Station numbers are indicated across the top.*

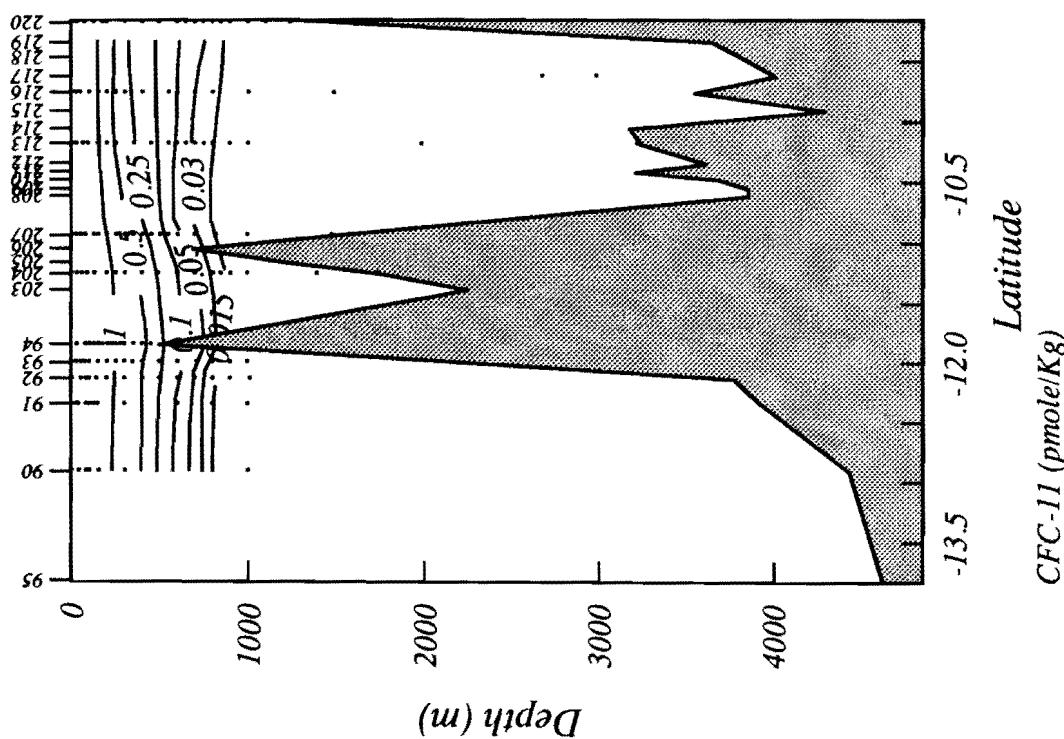

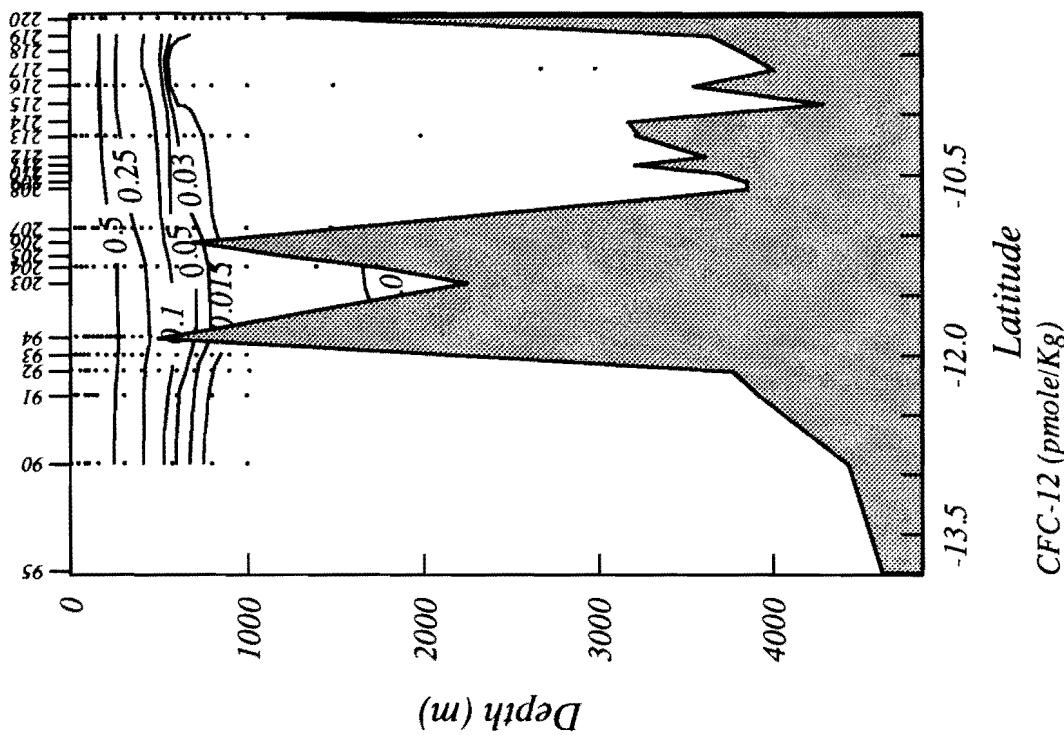

*CFC-11 and CFC-12 sections across the Coral Sea during TEW.
Station numbers are indicated across the top.*

*Dissolved Oxygen section across the Coral Sea during TEW.
Station numbers are indicated across the top.*

*CFC-11 and CFC-12 sections across the Coral Sea during TEW.
Station numbers are indicated across the top.*

TEW 241

5.4 CO2-87 (CO2-87-OC)

This section includes the following data collected during the CO2-87 cruise (30 July to 28 Aug, 1987).

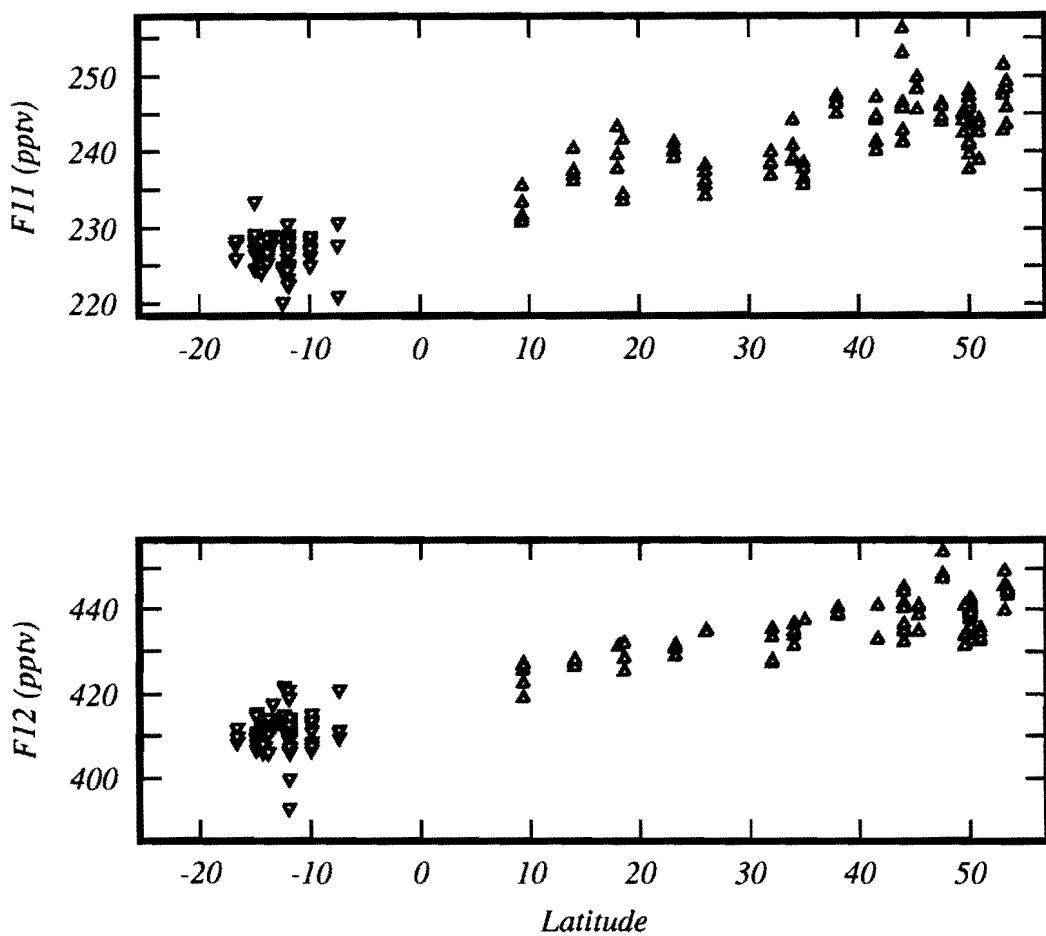

- 1) Station location plot.
- 2) Station location and bottom depth listing.
- 3) CFC atmospheric measurement plot.
- 4) CFC atmospheric measurement listing.
- 5) Contoured sections of Potential Temperature, Salinity, Oxygen, CFC-11 and CFC-12 along 165° E. from 5° S. to 50 N°. (The data from TEW Leg 3 have been combined with the CO2-87 data for these plots.) Contoured sections from 167° E. to 129° W along 50° N are also presented. All sections are derived from bottle data.
- 6) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 7) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Only the upper 1500 meters of data are displayed as the CFC signal is below detection limits in deeper water. Any station which has no CFC data in the range 0–1500 meters will appear as a blank box. Units are in picomoles per kilogram.

CO₂-87 Station Locations.
R/V OCEANOGRAPHER
30 July - 28 August, 1987
Kwajalein - Dutch Harbor - Seattle.

Atmospheric Measurements during the TEW and CO2-87 cruises. The average northern hemisphere concentrations of the two CFC's are 242.7 and 436.6 for CFC-11 and CFC-12, respectively. The average southern hemisphere concentrations are 226.9 and 411.2.

Salinity section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.

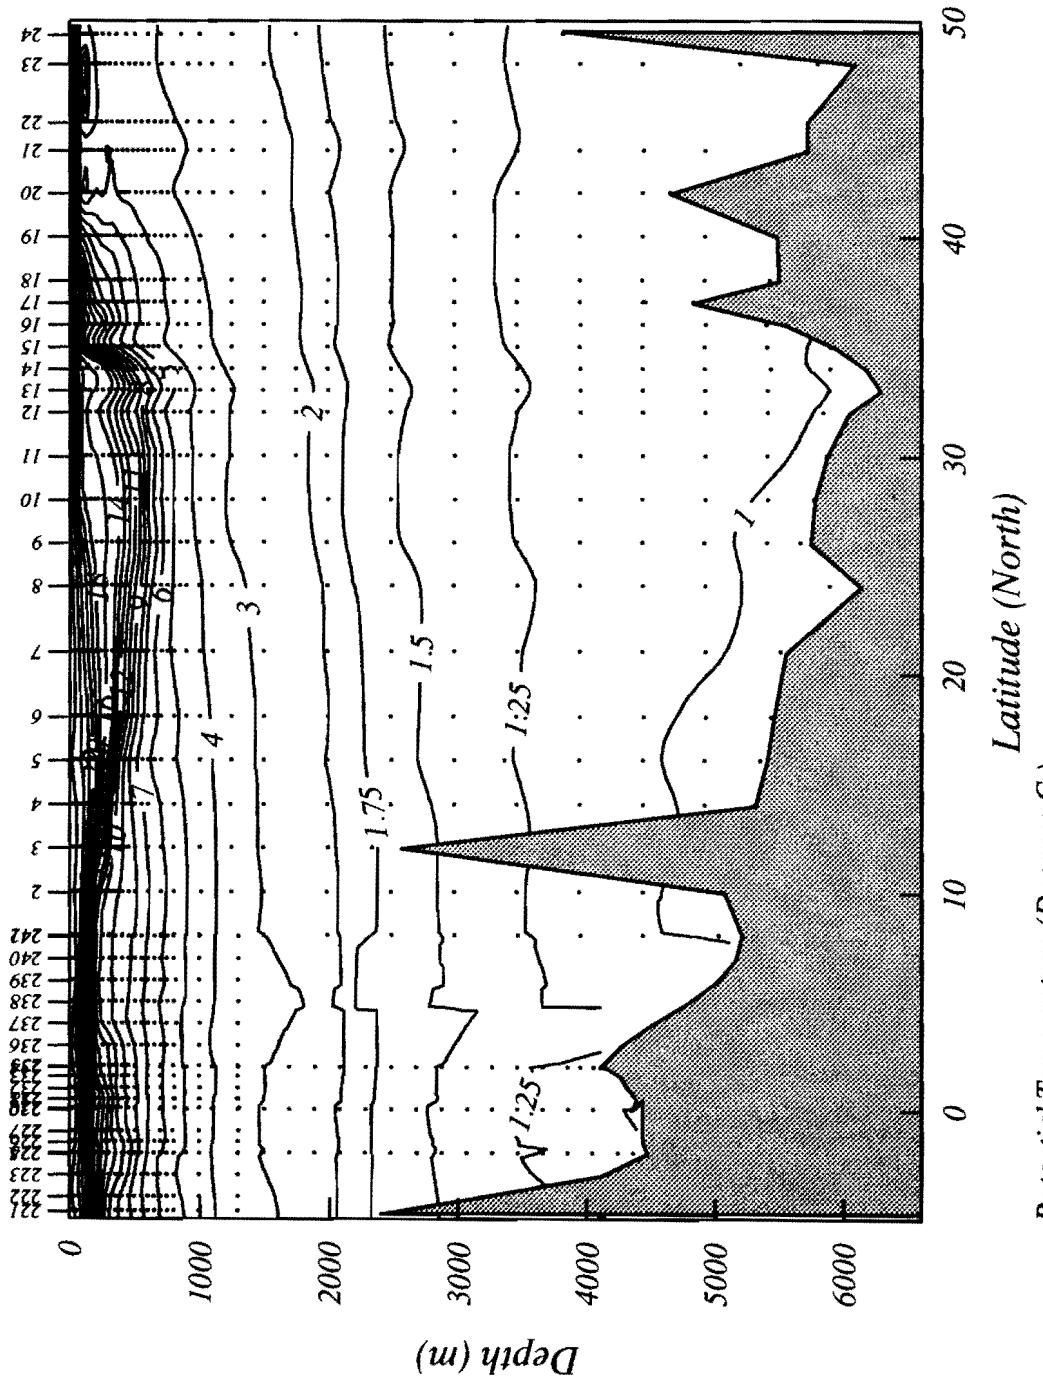

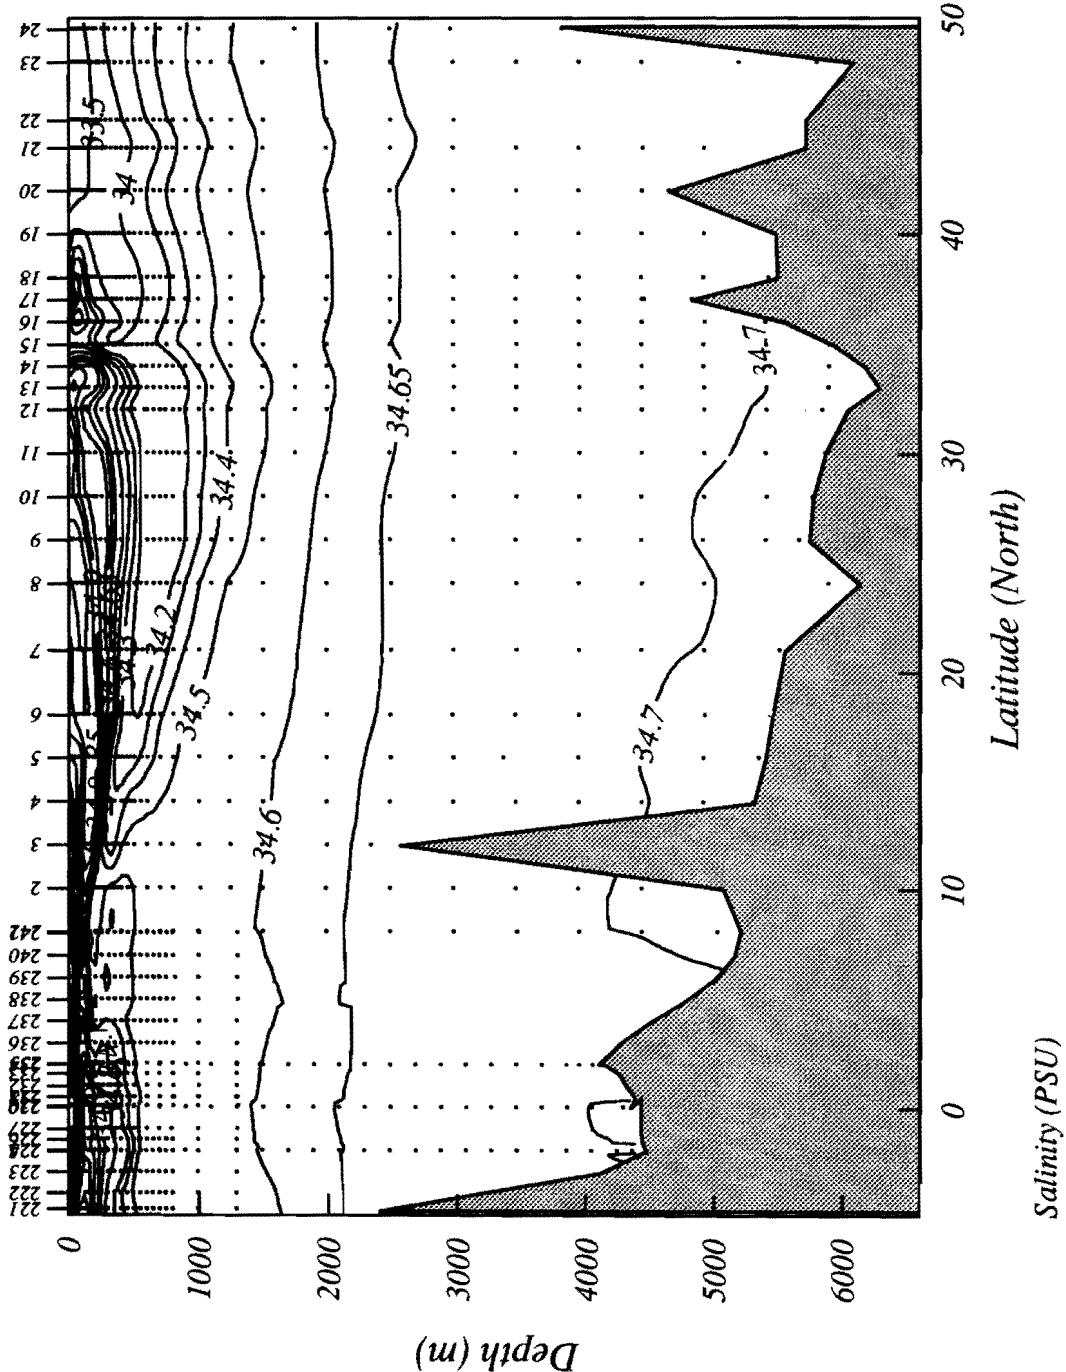

CFC-11 section along 165°E during the TEW Leg 3 & CO₂-87 Cruises.
Station numbers are indicated across the top.

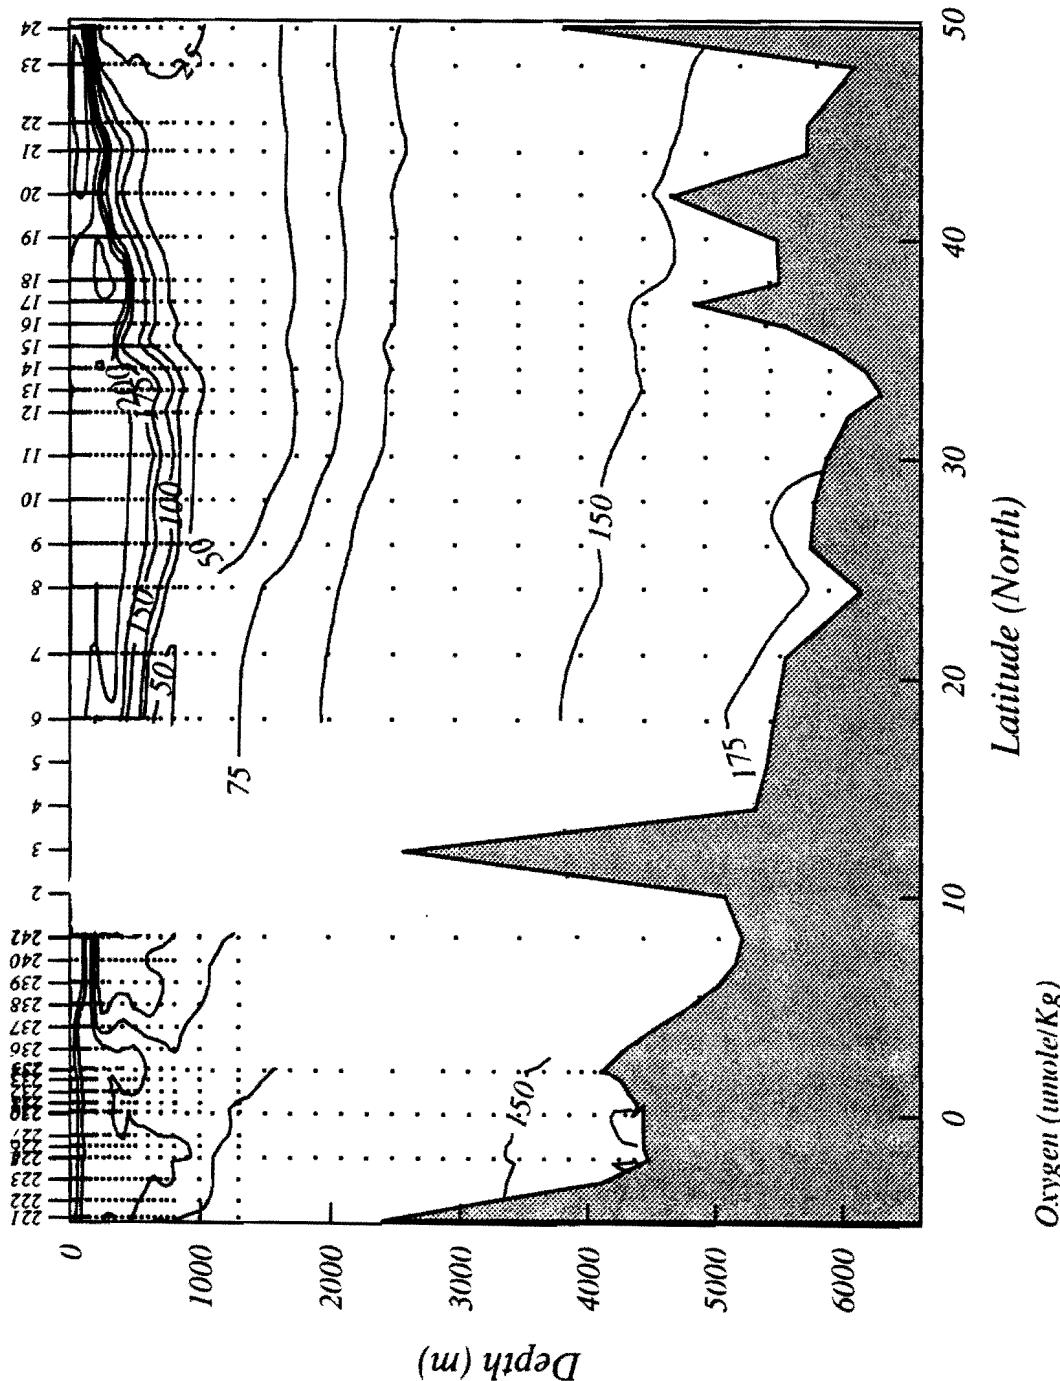

CFC-12 section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.

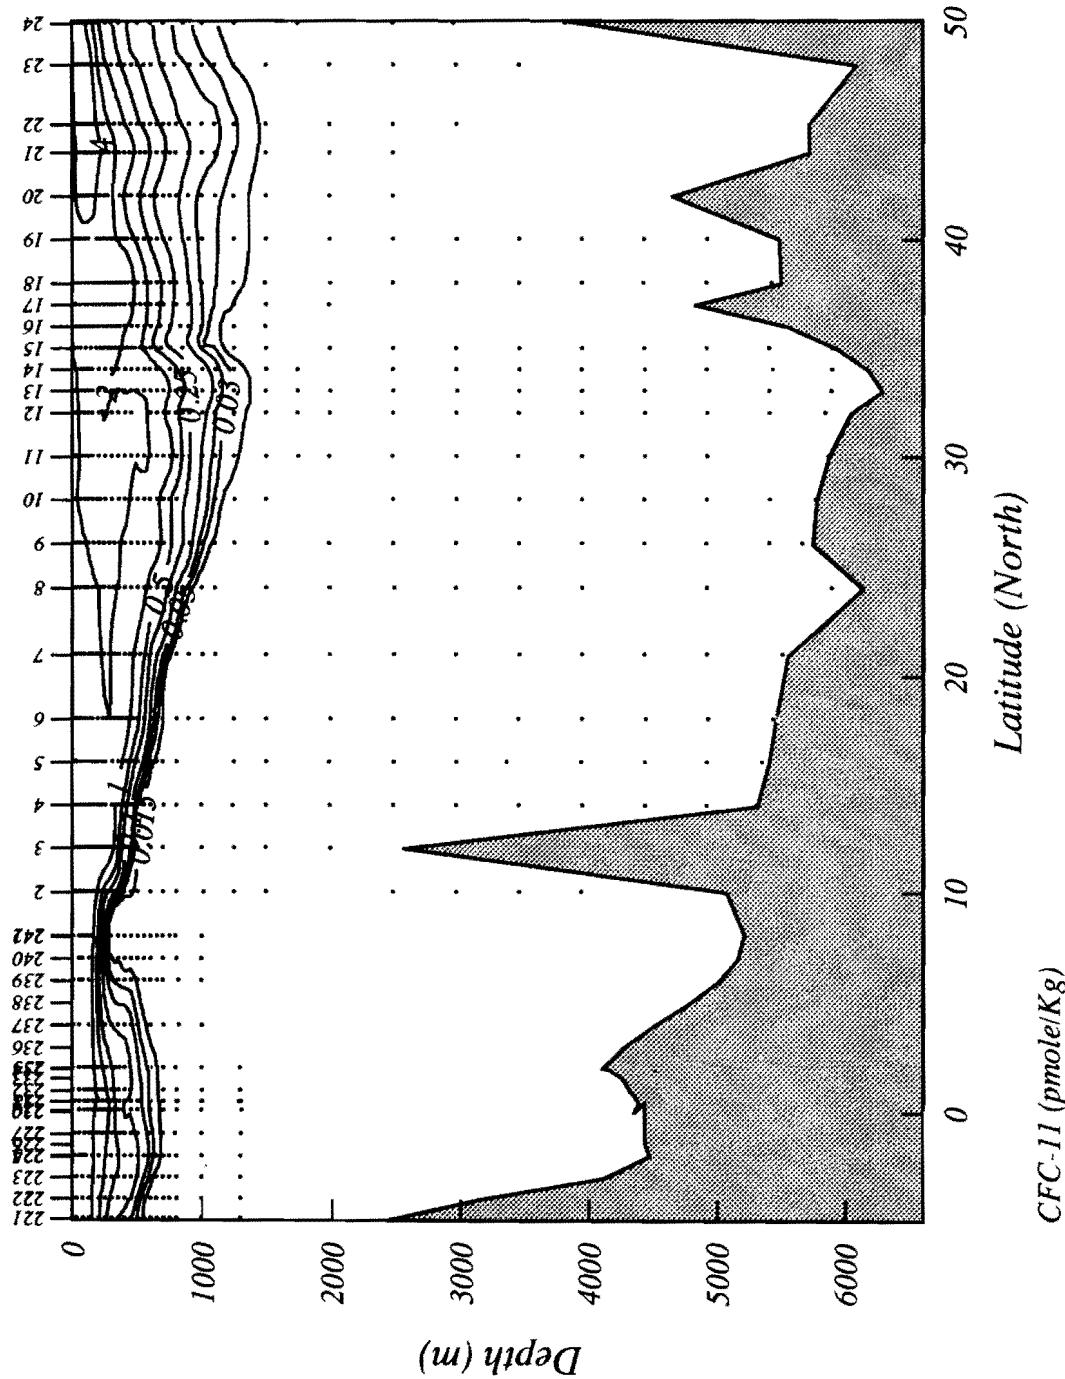

Potential Temperature section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.

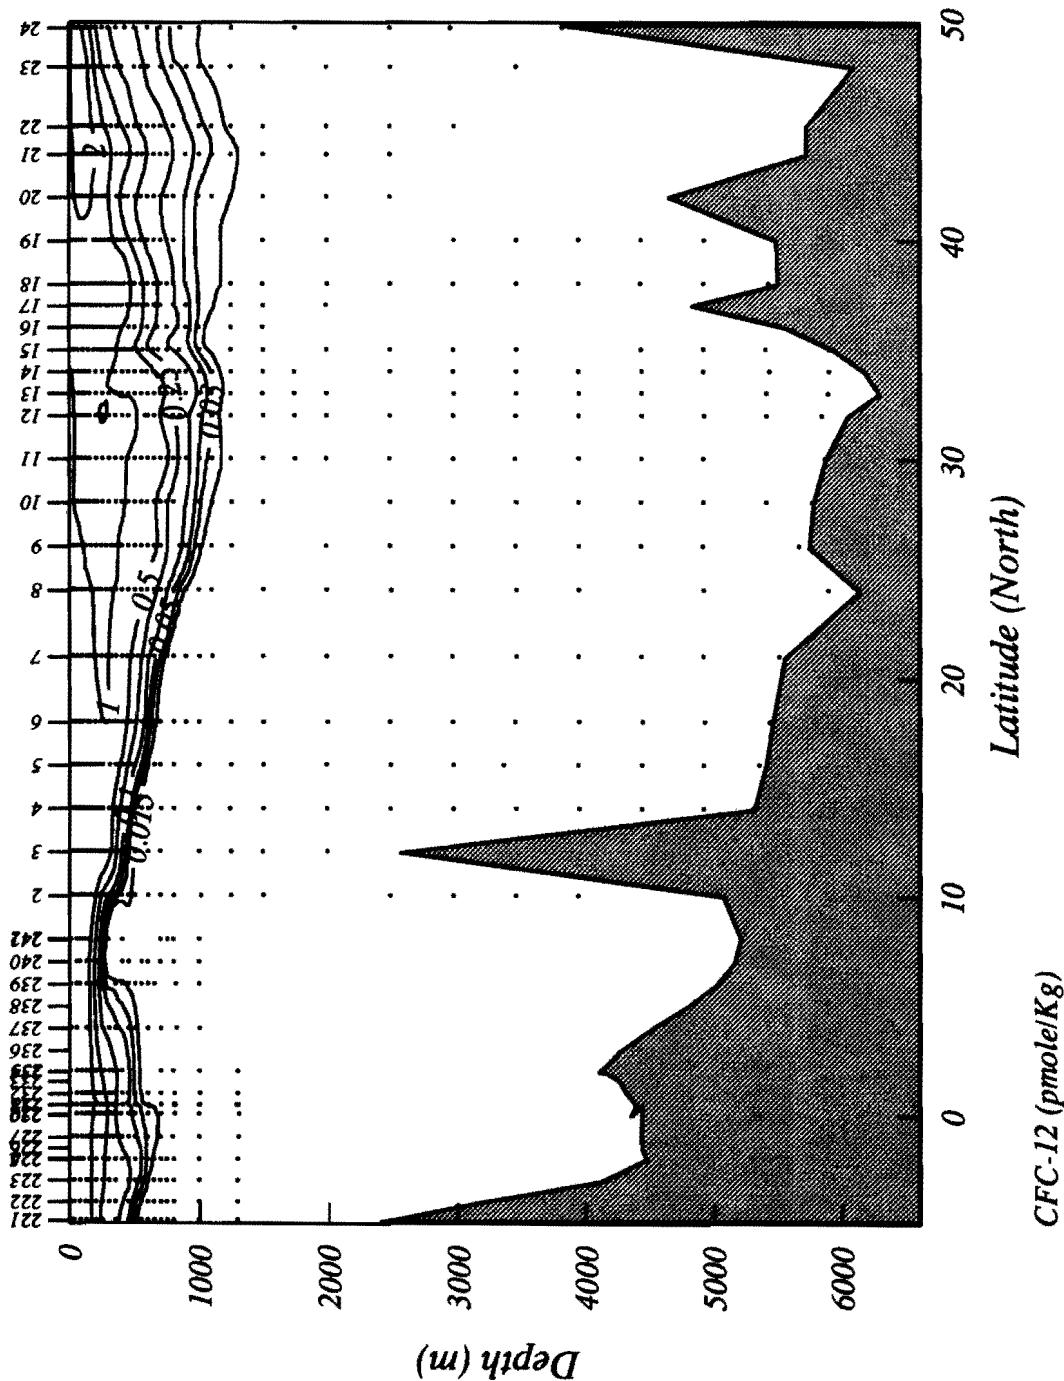

Salinity section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.

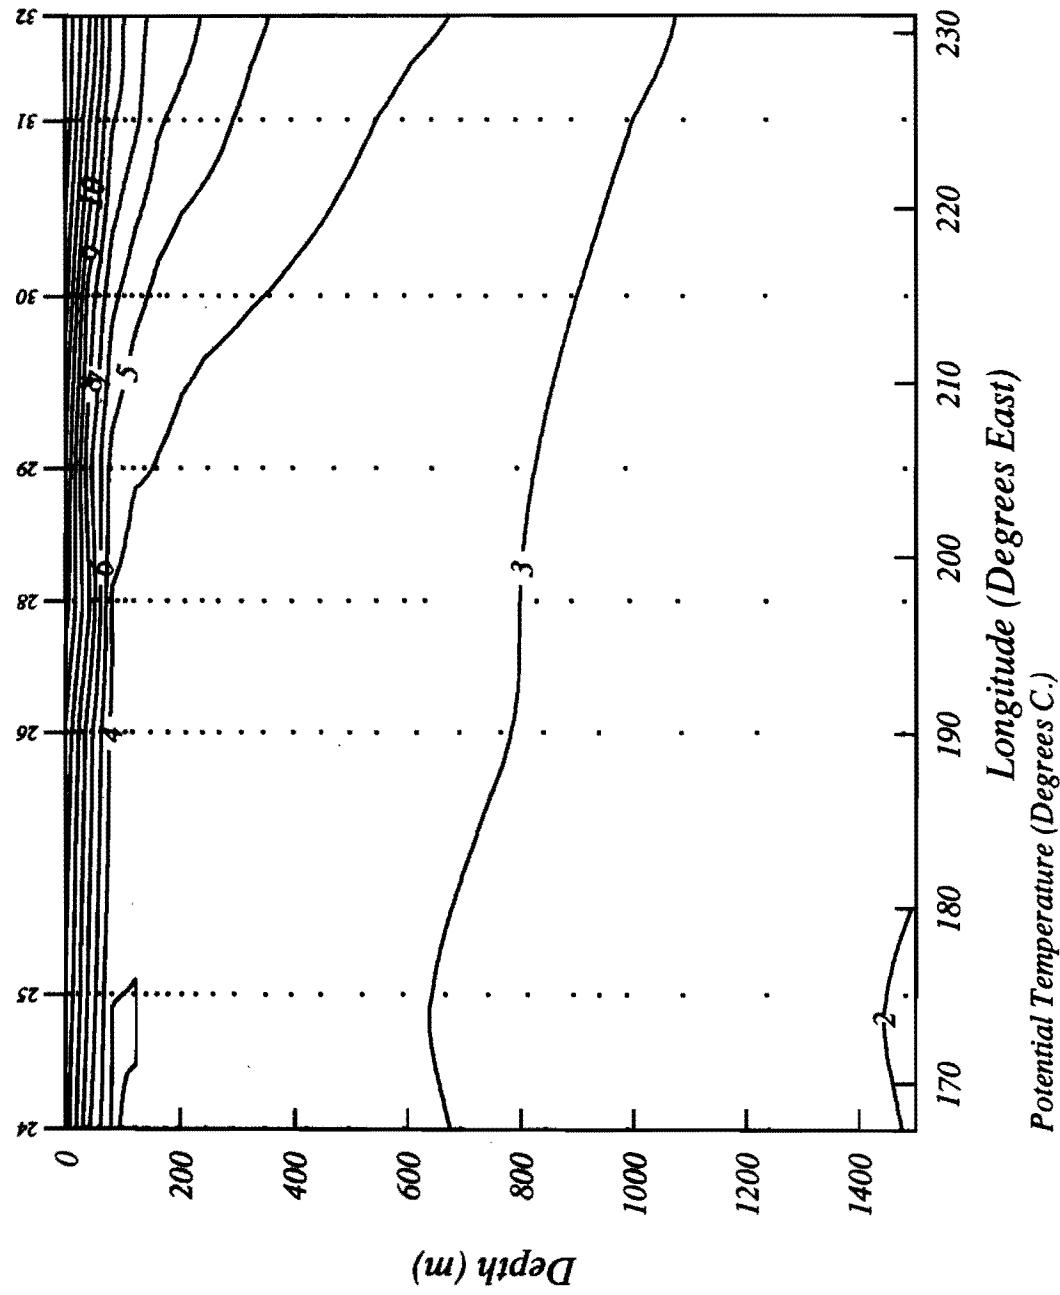

*Dissolved Oxygen section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.*

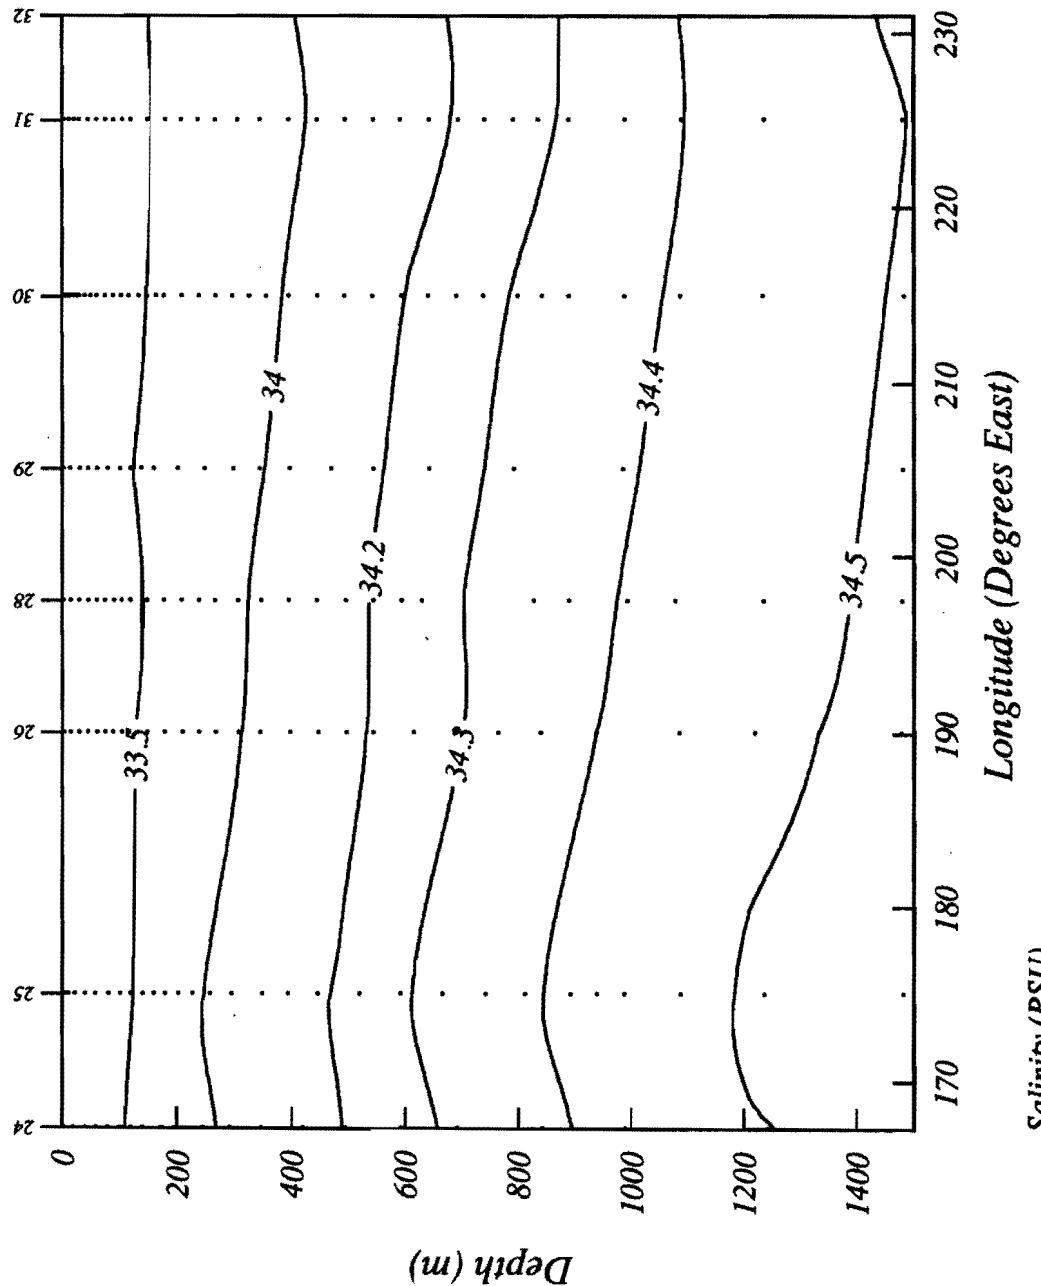

CFC-11 section along 165°E during the TEW Leg3 & CO2-87 Cruises.
Station numbers are indicated across the top.

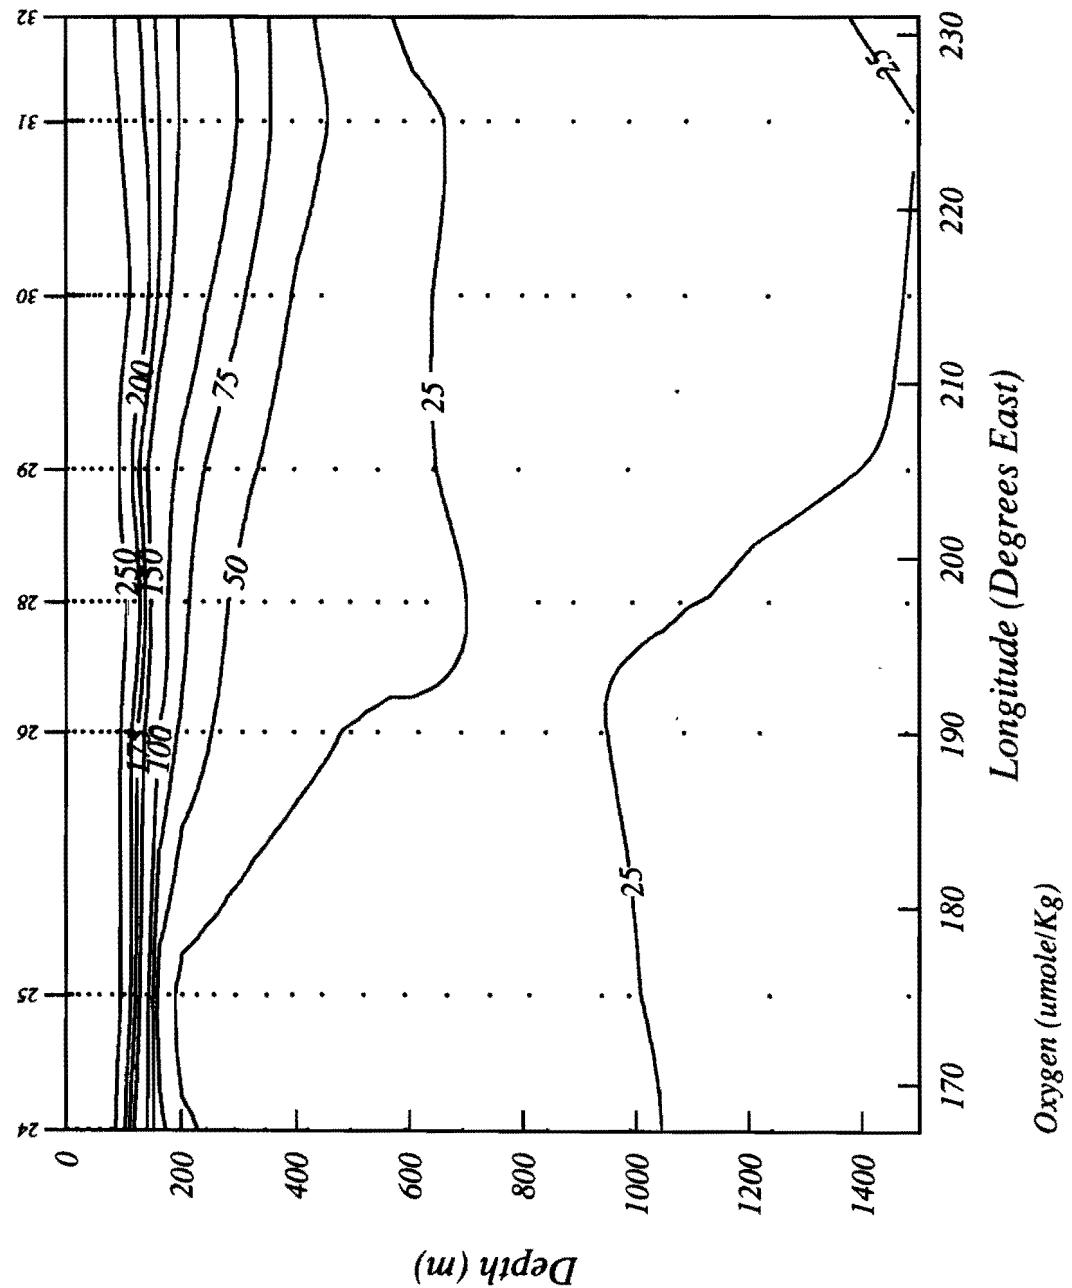

CFC-12 section along 165°E during the TEW Leg 3 & CO2-87 Cruises.
Station numbers are indicated across the top.

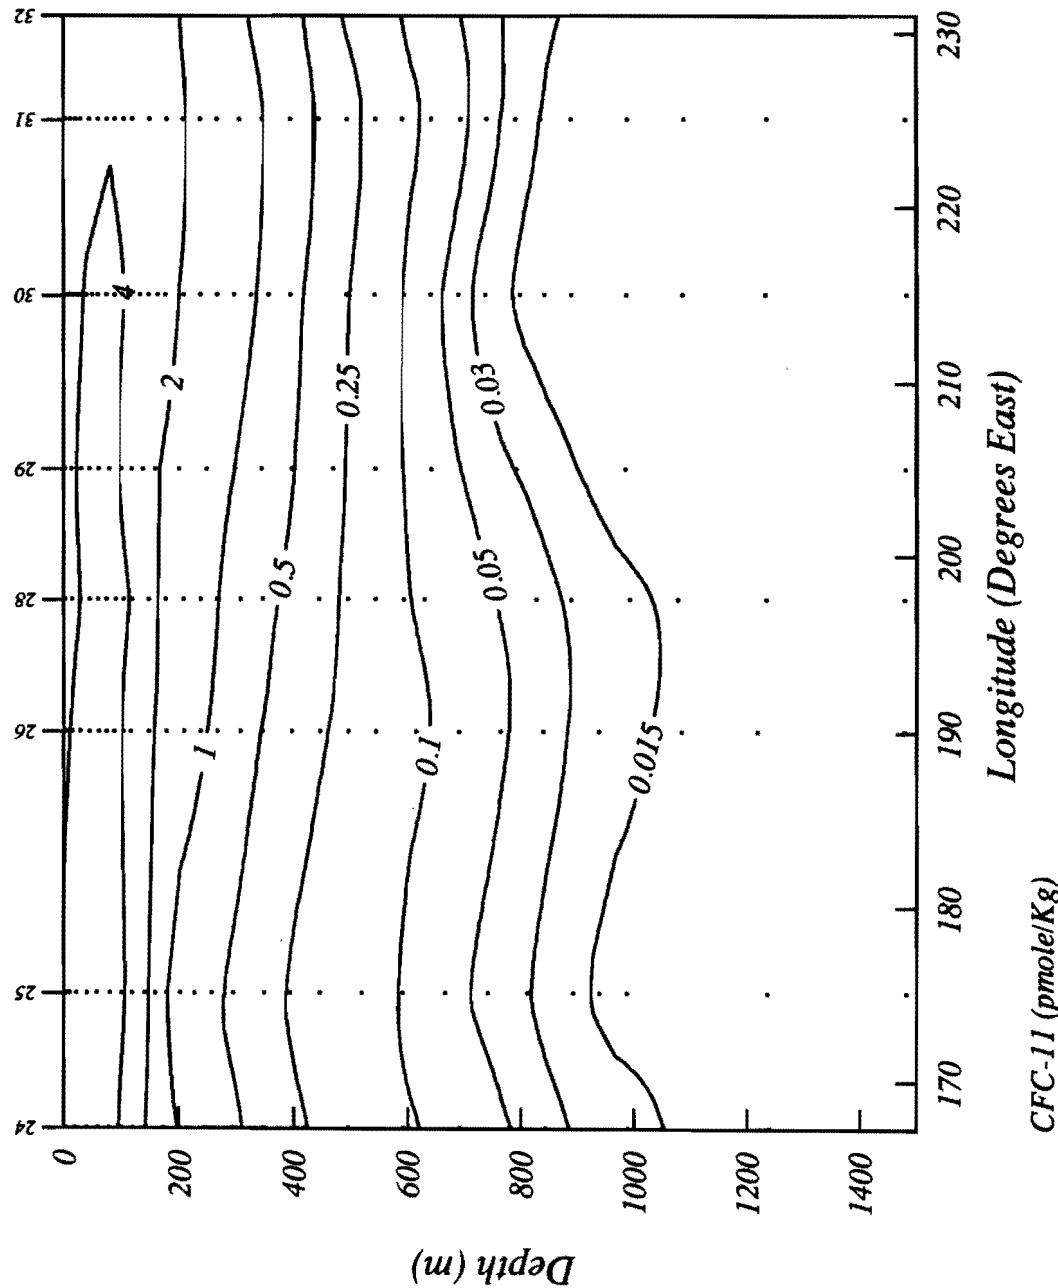

Potential Temperature section along 50 North during the CO2-87 Cruise
Station numbers are indicated across the top.

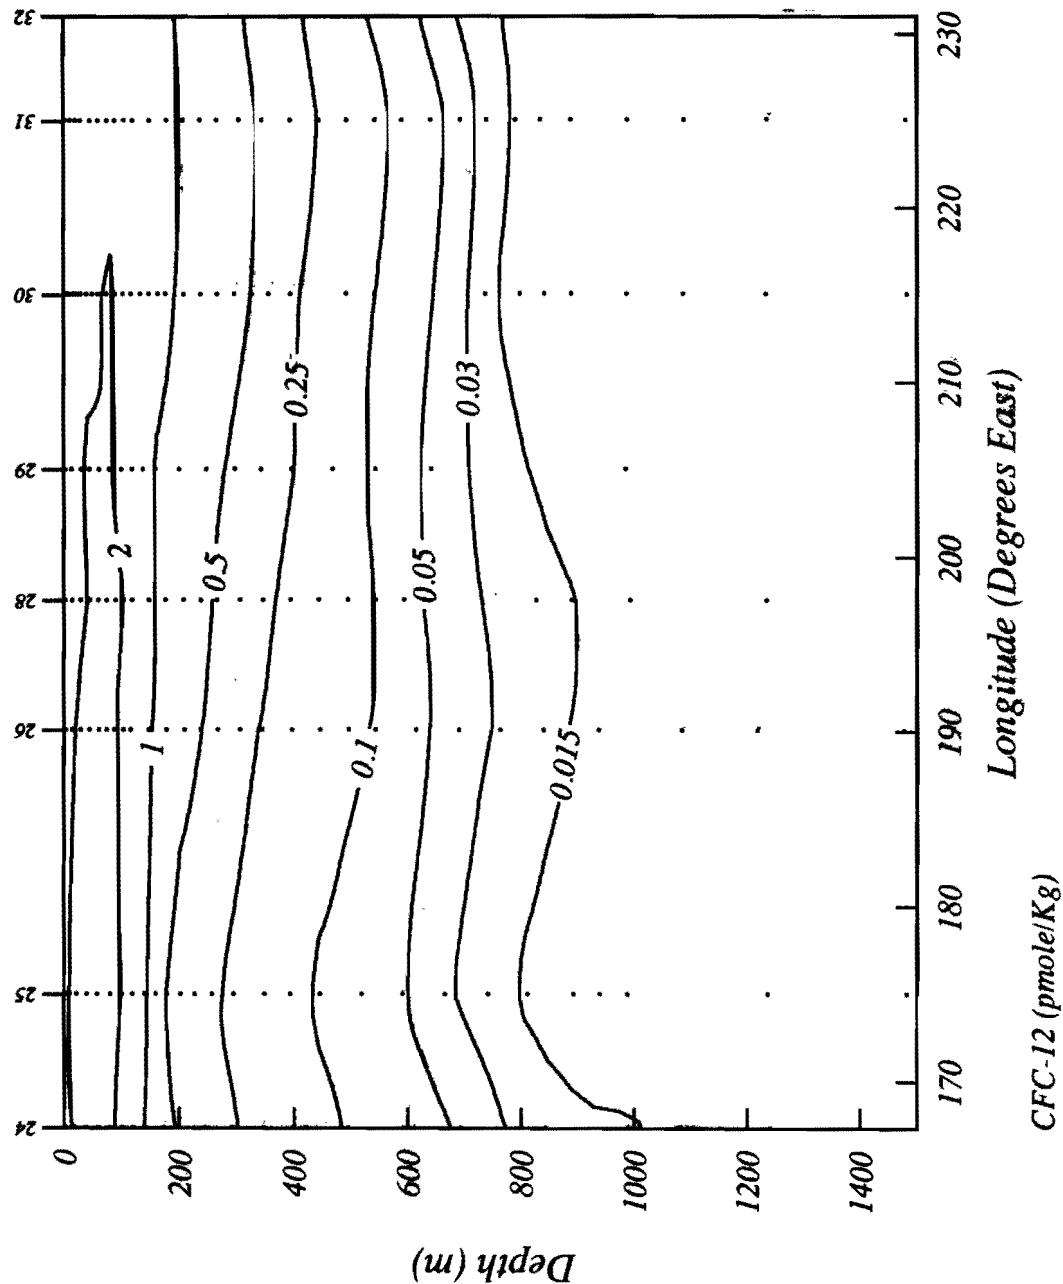

Salinity section along 50°N during the CO2-87 Cruise
Station numbers are indicated across the top.

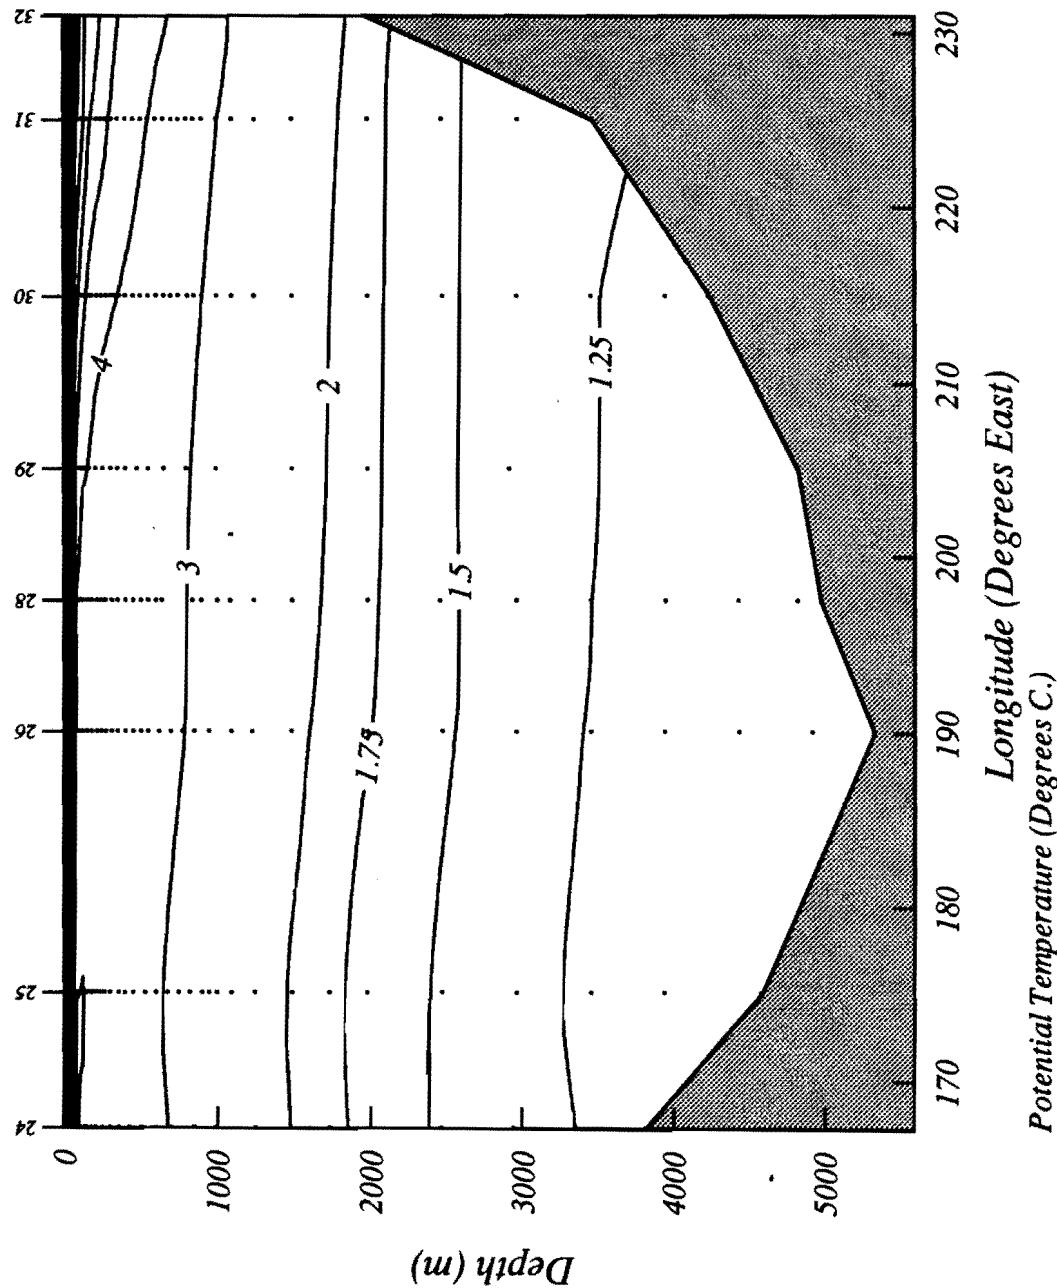

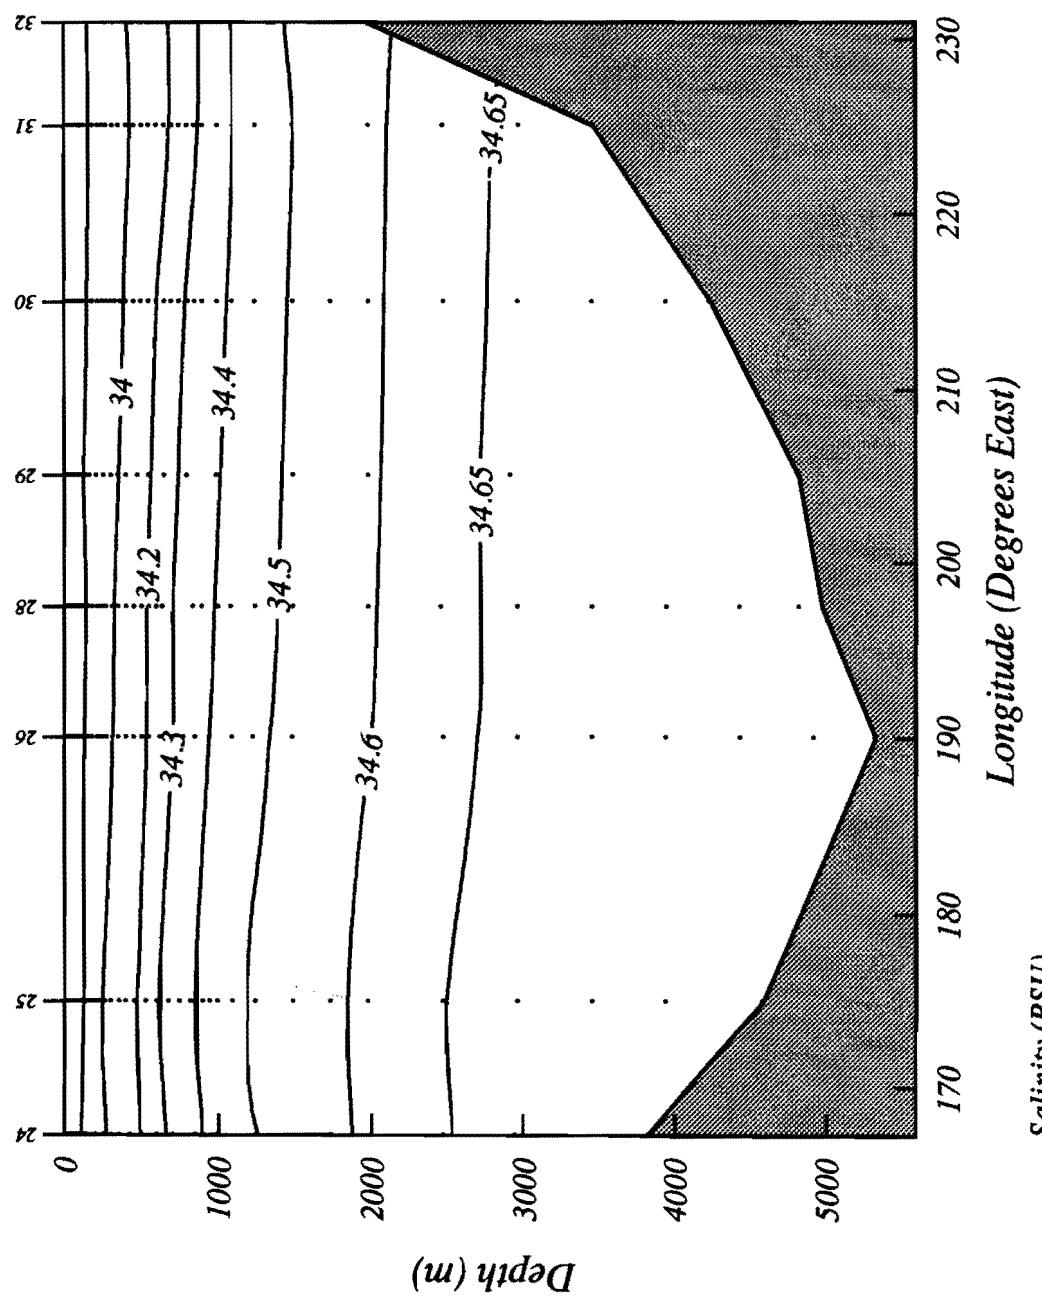

CFC-11 section along 50°N during the CO2-87 Cruise
Station numbers are indicated across the top.

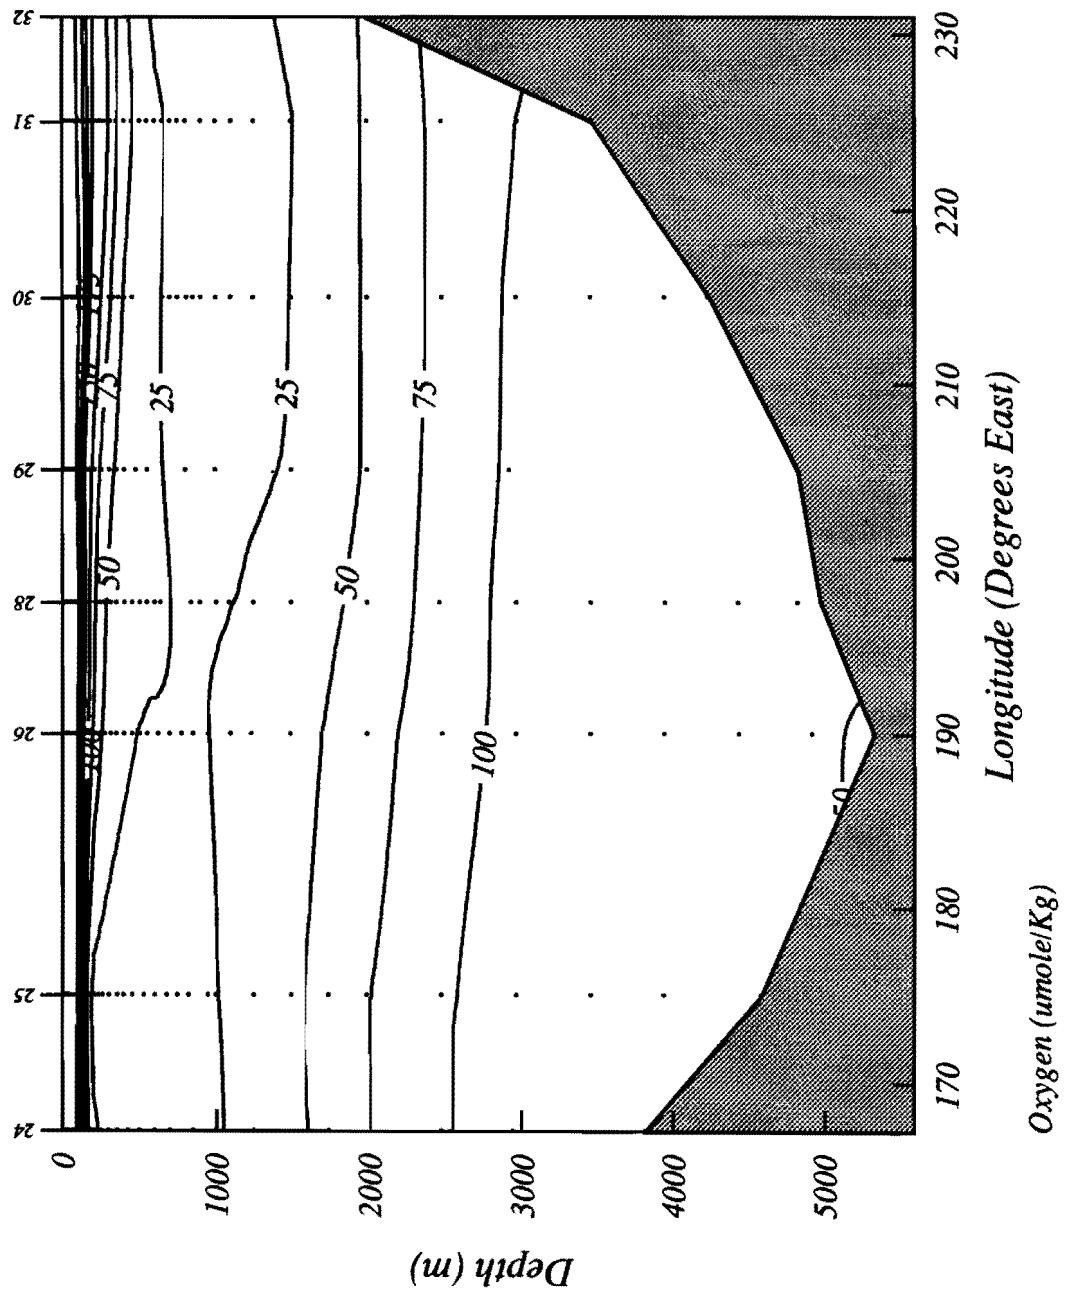

*CFC-12 section along 50°N during the CO₂-87 Cruise
 Station numbers are indicated across the top.*

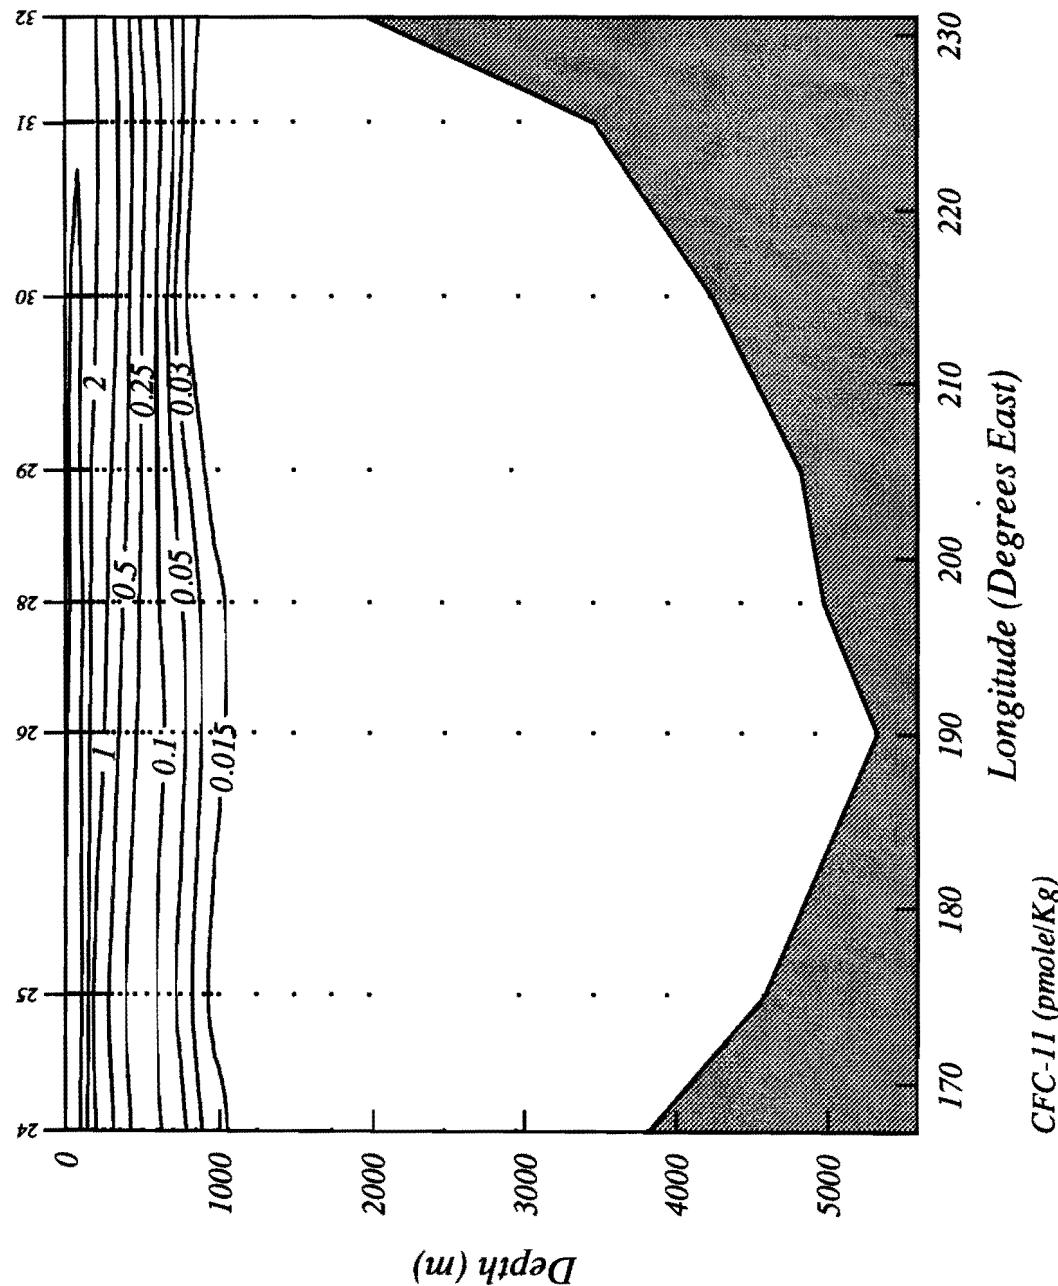

*Potential Temperature section along 50 North during the CO2-87 Cruise
 Station numbers are indicated across the top.*

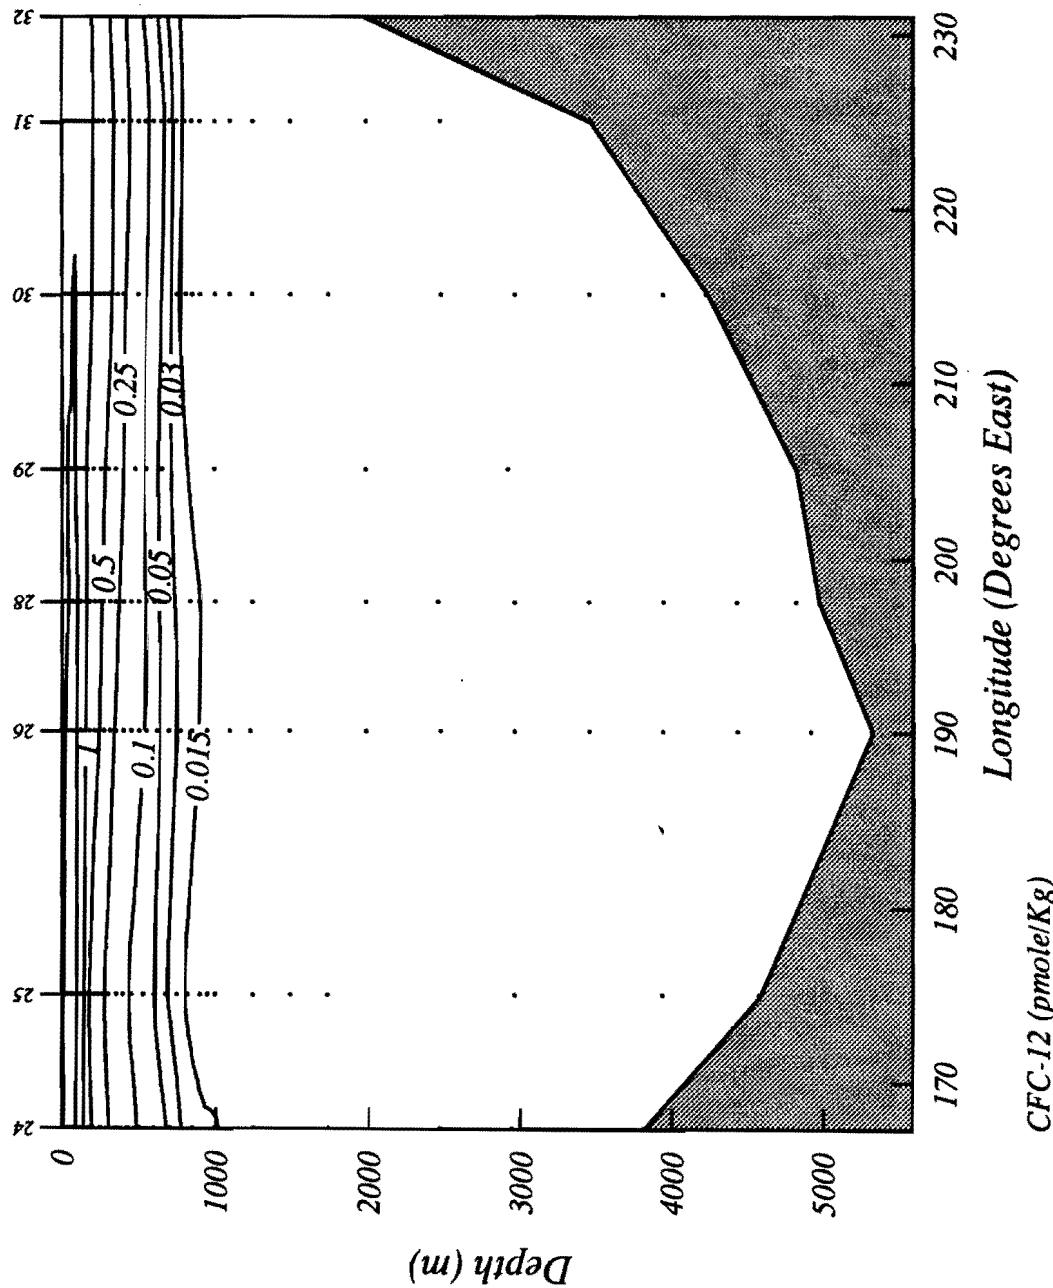

Salinity section along 50°N during the CO2-87 Cruise
Station numbers are indicated across the top.

Dissolved Oxygen section along 50 North during the CO2-87 Cruise
Station numbers are indicated across the top.

*CFC-11 section along 50°N during the CO2-87 Cruise
 Station numbers are indicated across the top.*

CFC-12 section along 50°N during the CO₂-87 Cruise
Station numbers are indicated across the top.

5.5 CO₂-88 (OC-88-CO₂)

This section includes the following data collected during the CO₂-88 cruise (6 April to 5 May, 1988).

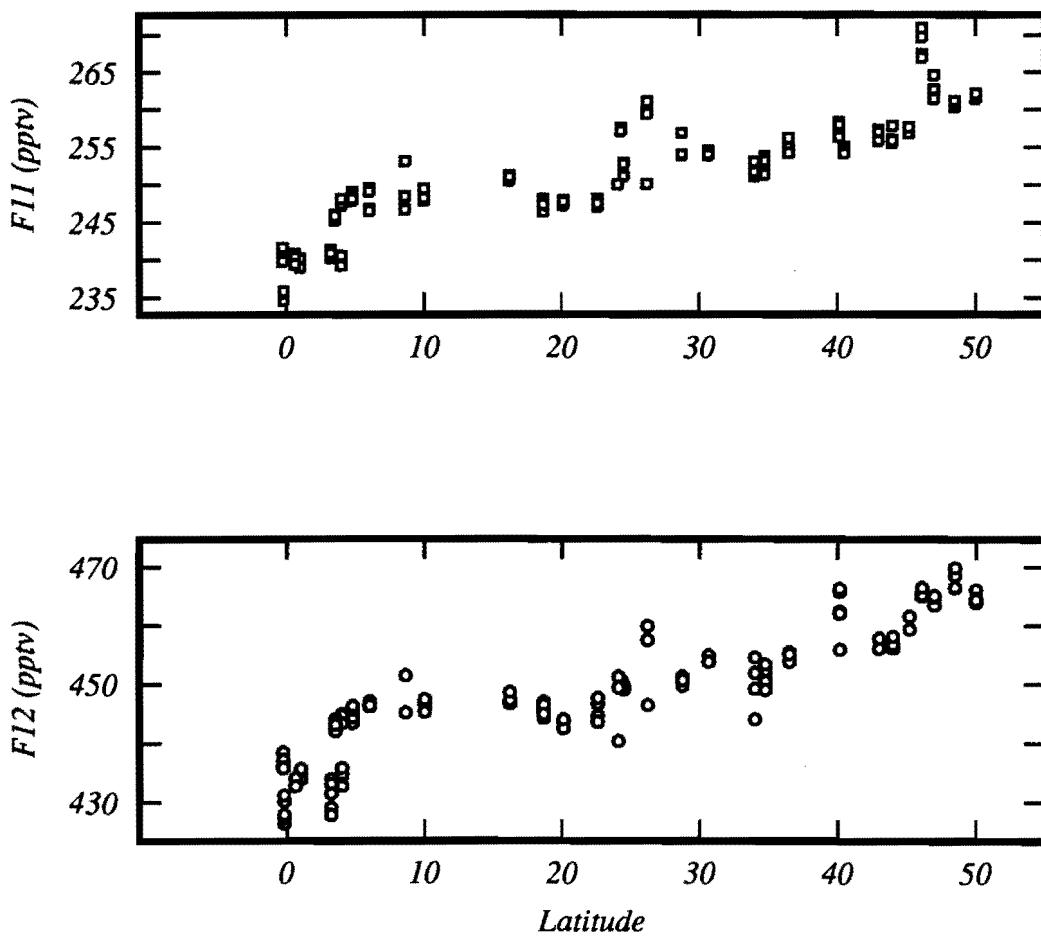

- 1) Station location plot.
- 2) Station location and bottom depth listing.
- 3) CFC atmospheric measurement plot.
- 4) CFC atmospheric measurement listing.
- 5) Contoured sections of Potential Temperature, Salinity, Oxygen, CFC-11 and CFC-12 along 170° W from 10° S. to 53 N°, derived from bottle data.
- 6) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 7) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Only the upper 1500 meters of data are displayed as the CFC signal is below detection limits in deeper water. Any station which has no CFC data in the range 0–1500 meters will appear as a blank box. Units are in picomoles per kilogram.

*CO2-88 Station Locations.

*Atmospheric Measurements during the CO2-88 cruises.
The average northern hemisphere concentrations of the
two CFC's are 254.4 and 453.6 for CFC-11 and CFC-12,
respectively.*

Salinity section along 170°W during the CO2-88 Cruise.
Station numbers are indicated across the top.

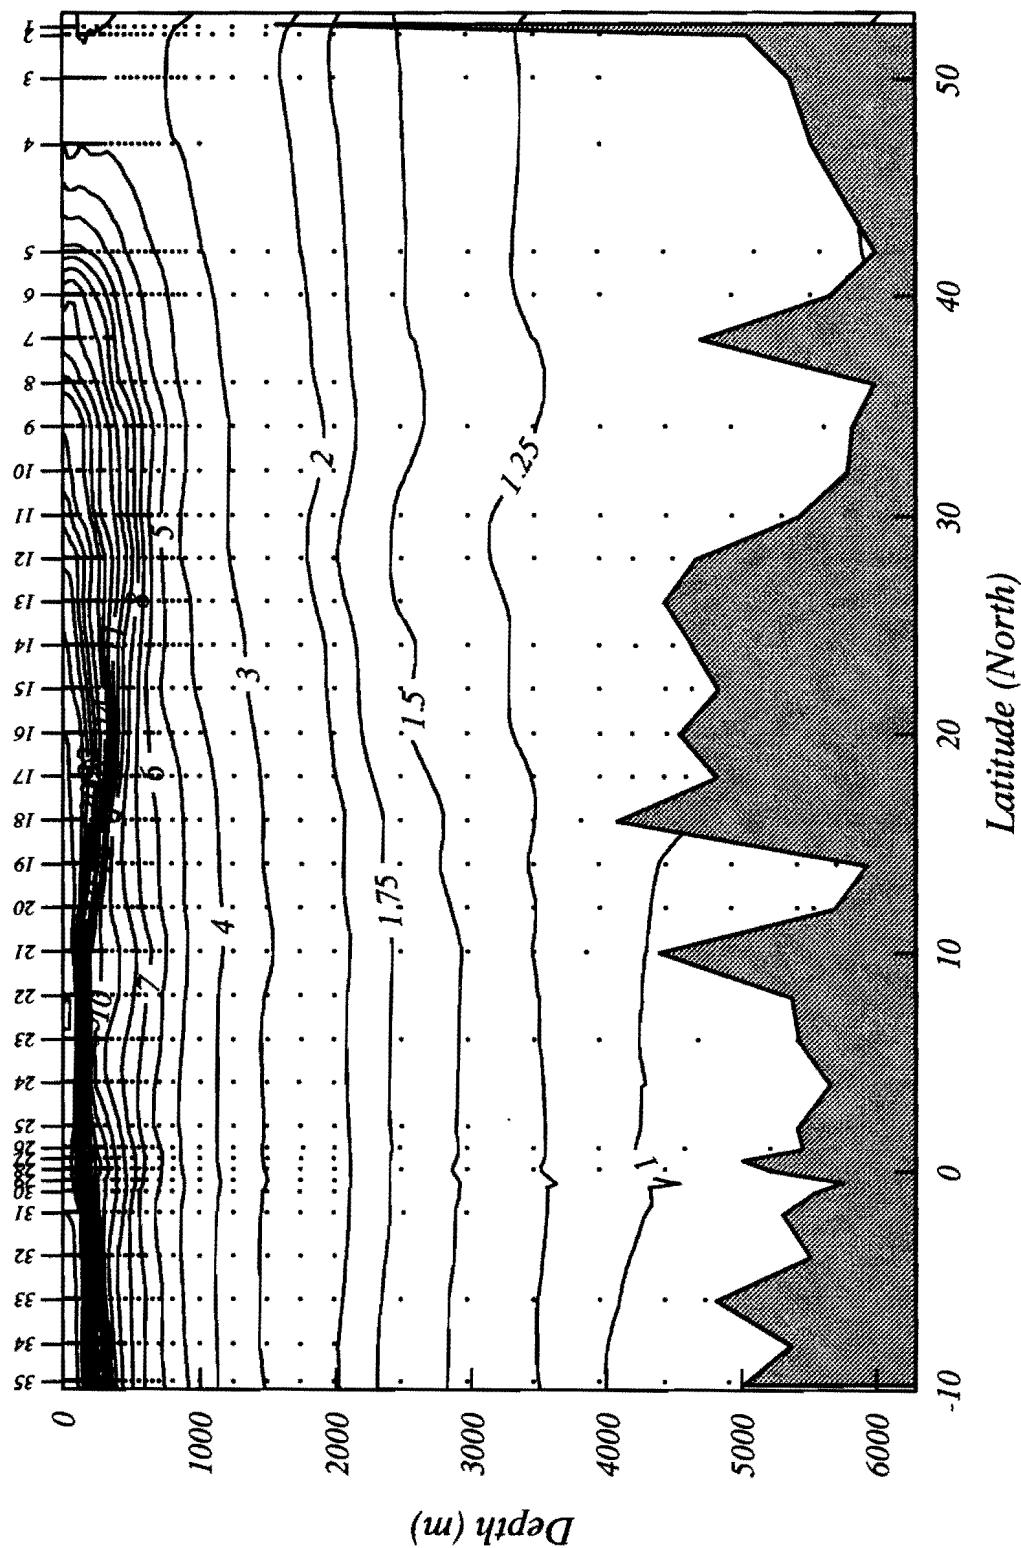

*Dissolved Oxygen section along 170°W during the CO₂-88 Cruise.
Station numbers are indicated across the top.*

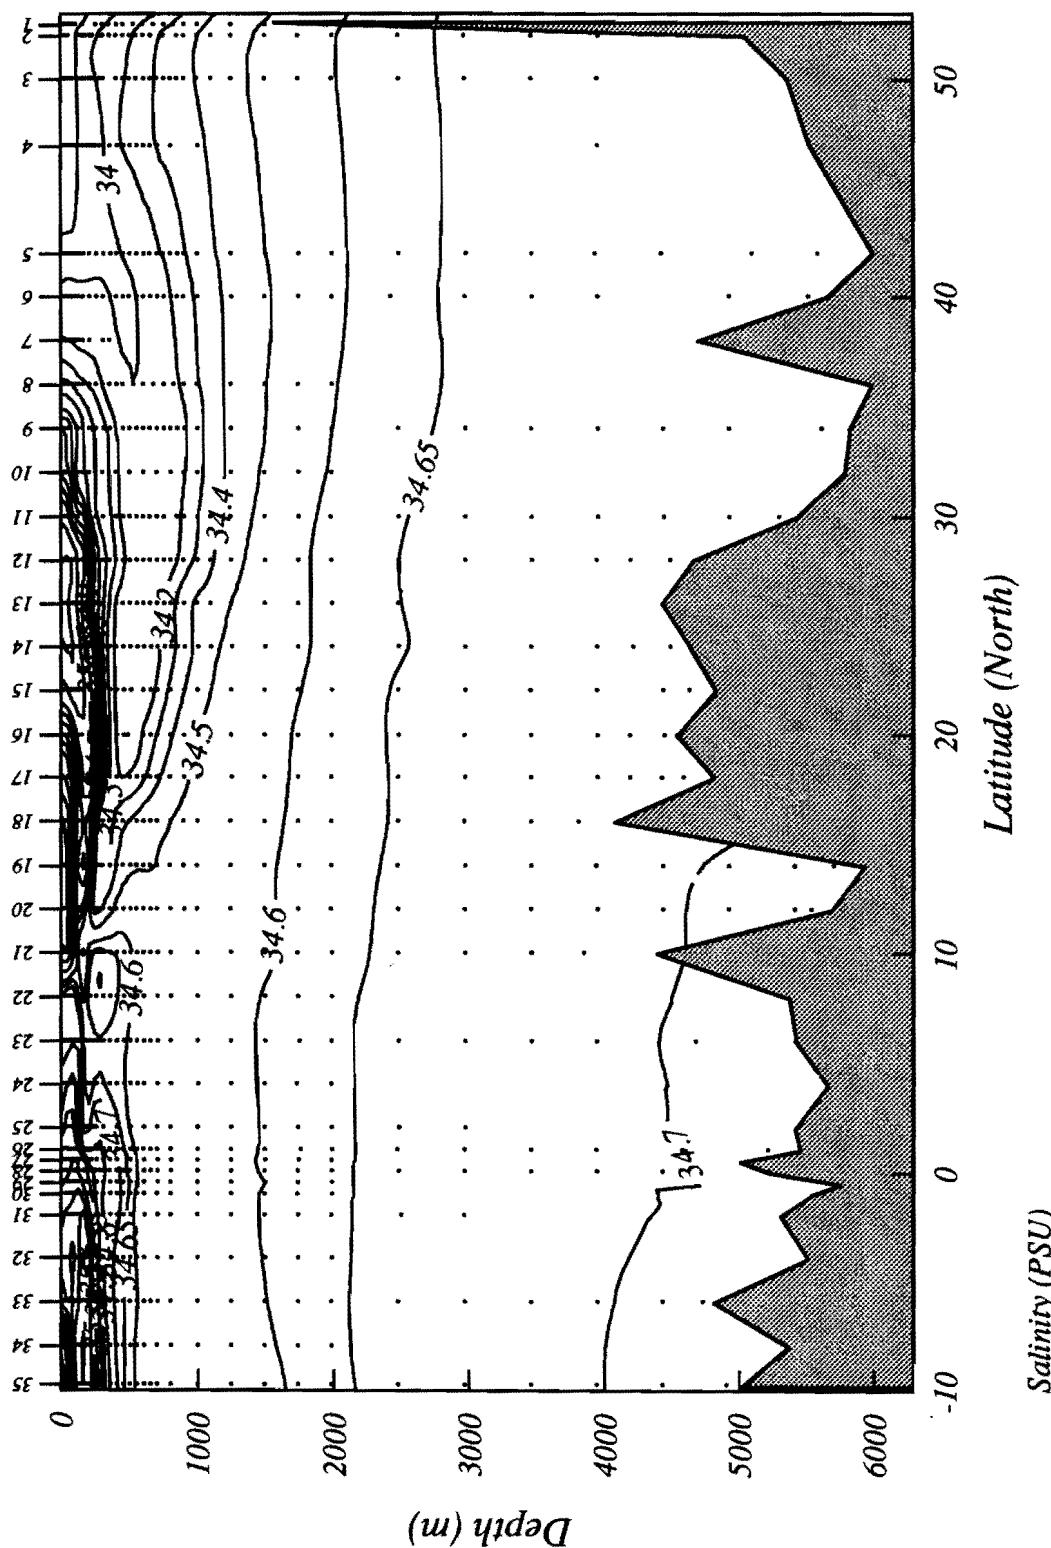

CFC-11 section along 170° West during the CO2-88 Cruise.
Station numbers are indicated across the top.

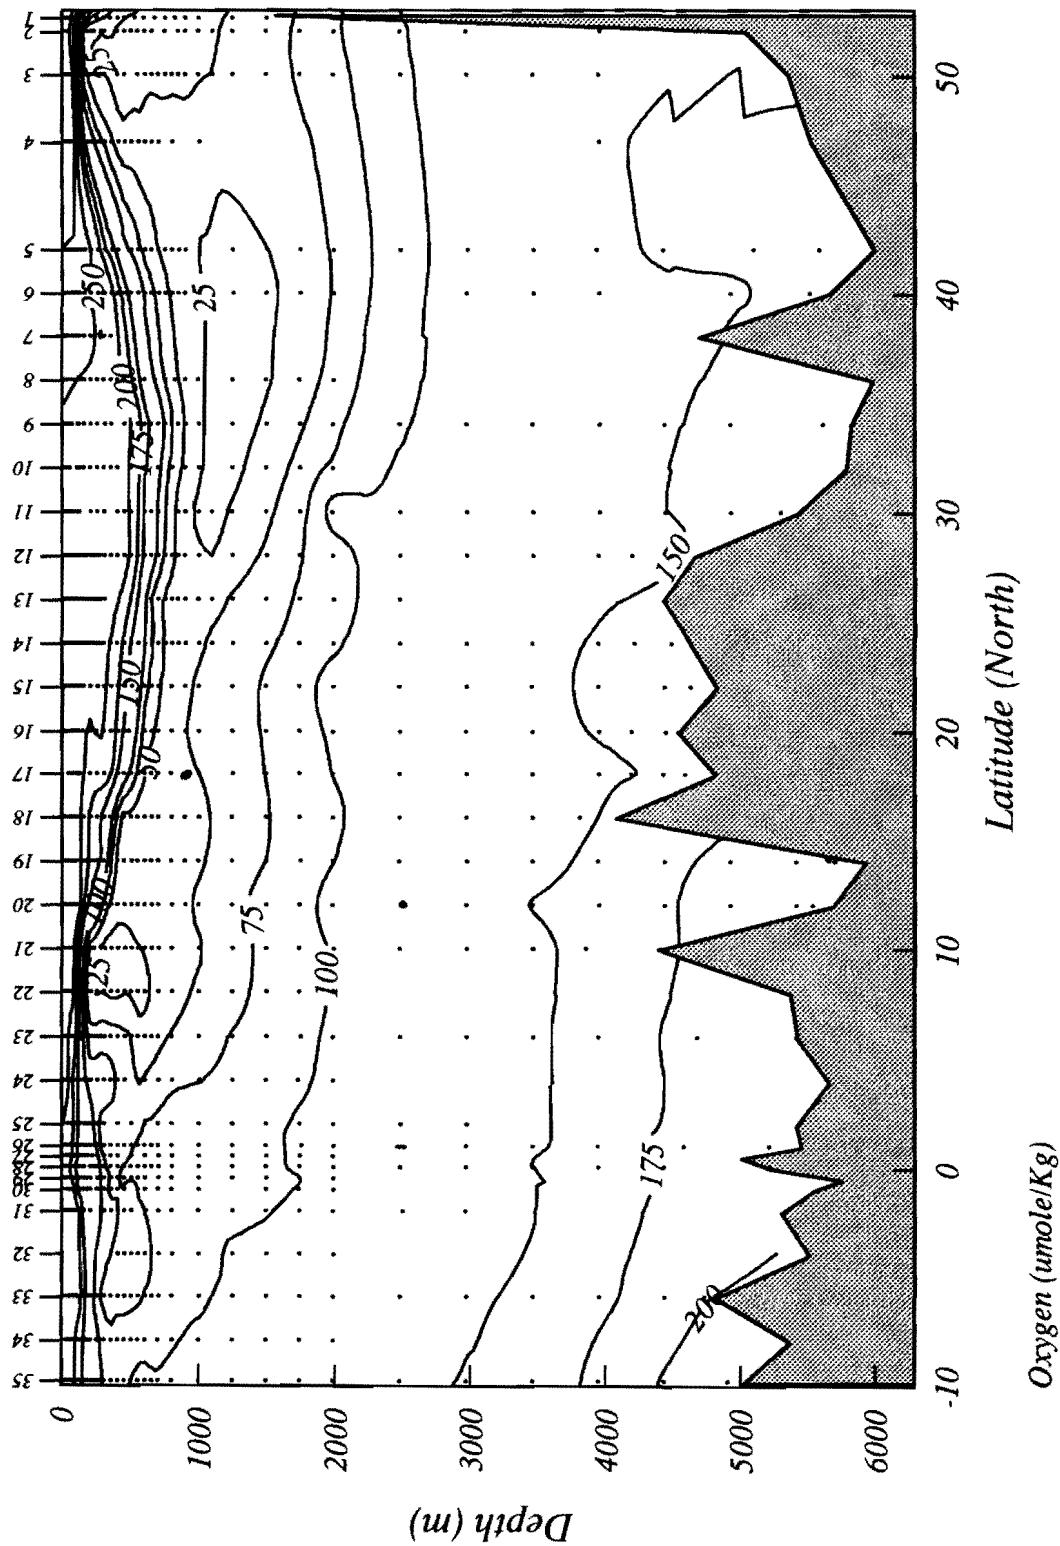

*CFC-12 section along 170° West during the CO₂-88 Cruise.
 Station numbers are indicated across the top.*

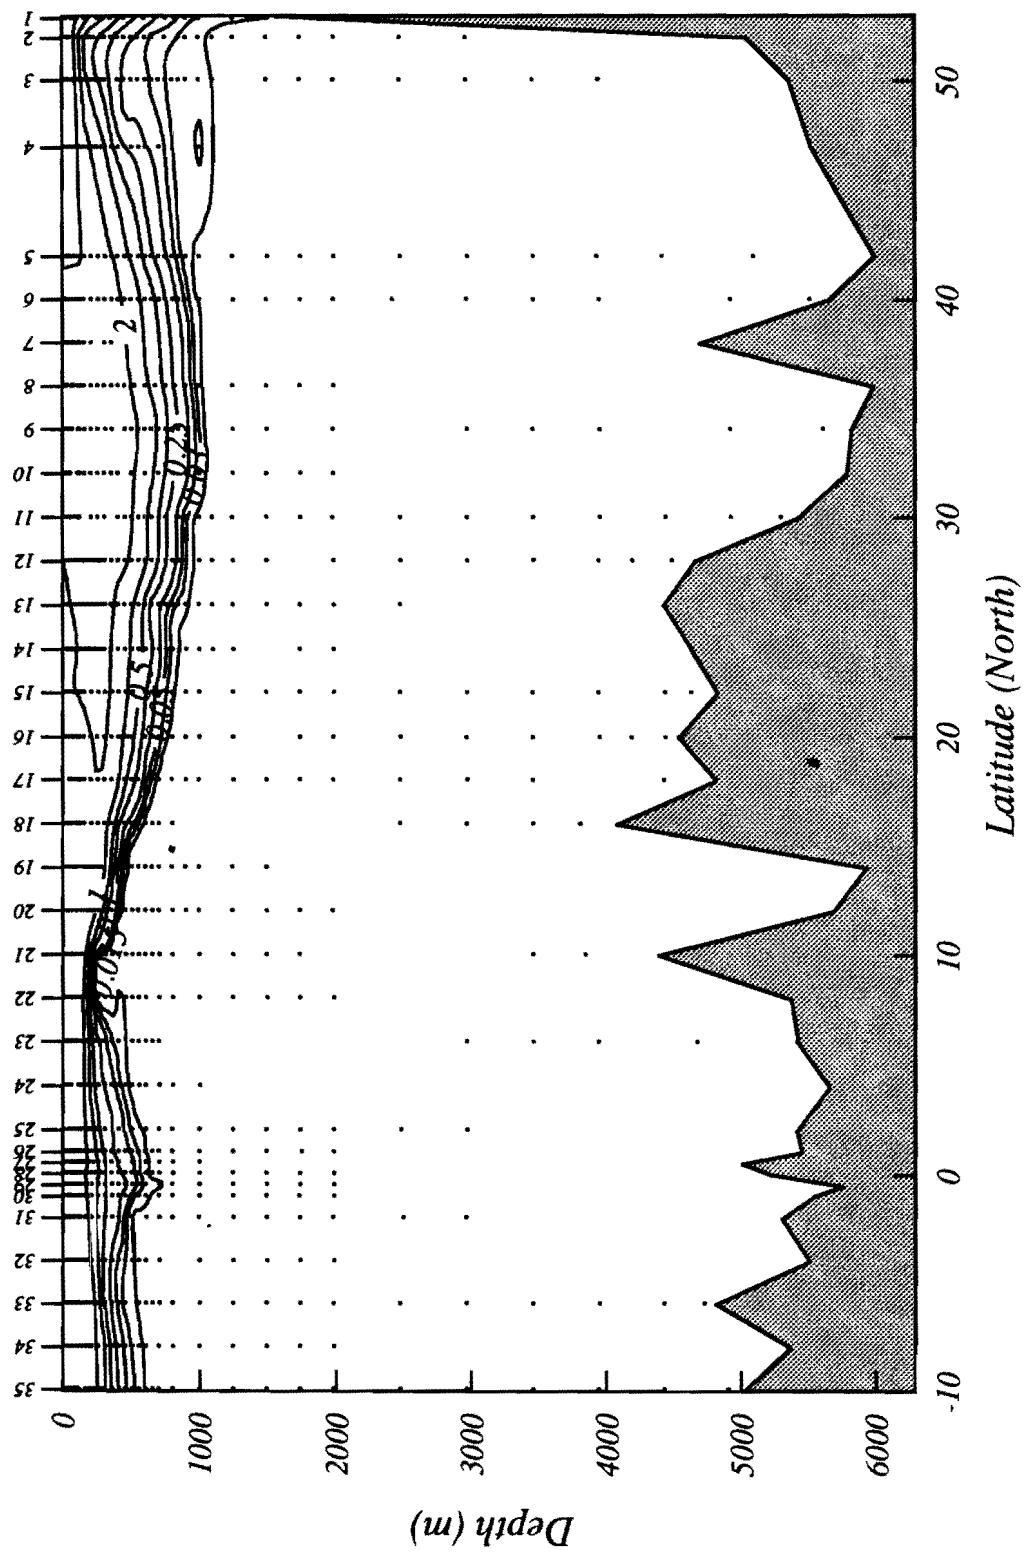

Potential Temperature section along 170° West during the CO2-88 Cruise.
Station numbers are indicated across the top.

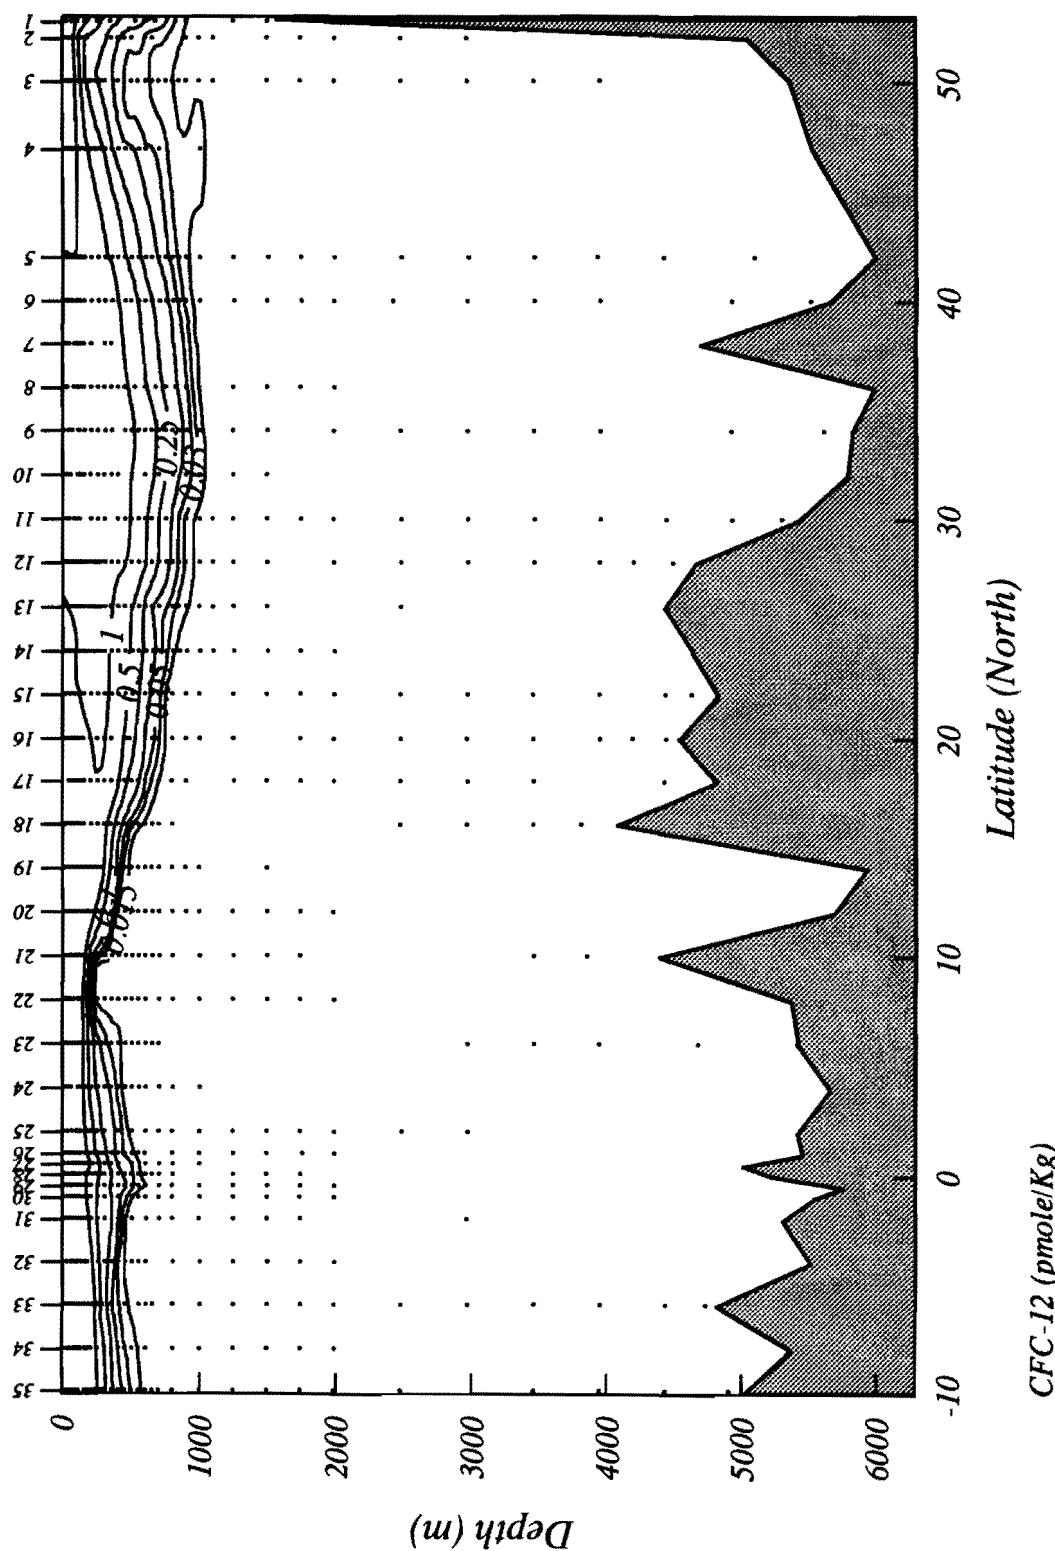

Salinity section along 170° West during the CO2-88 Cruise.
Station numbers are indicated across the top.

*Dissolved Oxygen section along 170°W during the CO_2 -88 Cruise.
Station numbers are indicated across the top.*

CFC-11 section along 170 West during the CO₂-88 Cruise.
Station numbers are indicated across the top.

CFC-12 section along 170° West during the CO2-88 Cruise.
Station numbers are indicated across the top.

5.6 CO2-89 (RTS-89-DI)

This section includes the following data collected during the CO2-89 cruise (15 Feb to 20 May, 1989).

- 1) Station location plot.
- 2) Station location and bottom depth listing.
- 3) CFC atmospheric measurement plot.
- 4) CFC atmospheric measurement listing.
- 5) Contoured sections of Potential Temperature, Salinity, Oxygen, CFC-11 and CFC-12 along 105° W from 14° N. to 60 S°, derived from bottle data.
- 6) Tables of hydrographic data including depth, pressure, potential temperature, salinity, sigma-theta, oxygen, CFC-11 and CFC-12. Atmospheric CFC-11 and CFC-12 values for each station are interpolated from surrounding air measurements, and used in calculating saturation values.
- 7) Individual vertical profiles of CFC-11 and CFC-12. Each page of CFC vertical profiles consists of a map of station locations and five station plots. Each station is plotted on two scales so that both high and low concentrations may be easily viewed. CFC-11 is represented by circles and CFC-12 by triangles; the solid symbols are plotted against the lower concentration scale on the bottom axis. Plots are made for the 0–1500 meter range and, since a deep signal was present in the southern stations, plots are made for the 0–6000 meter range.

*CO₂-89 Station Locations.
R/V DISCOVERER*

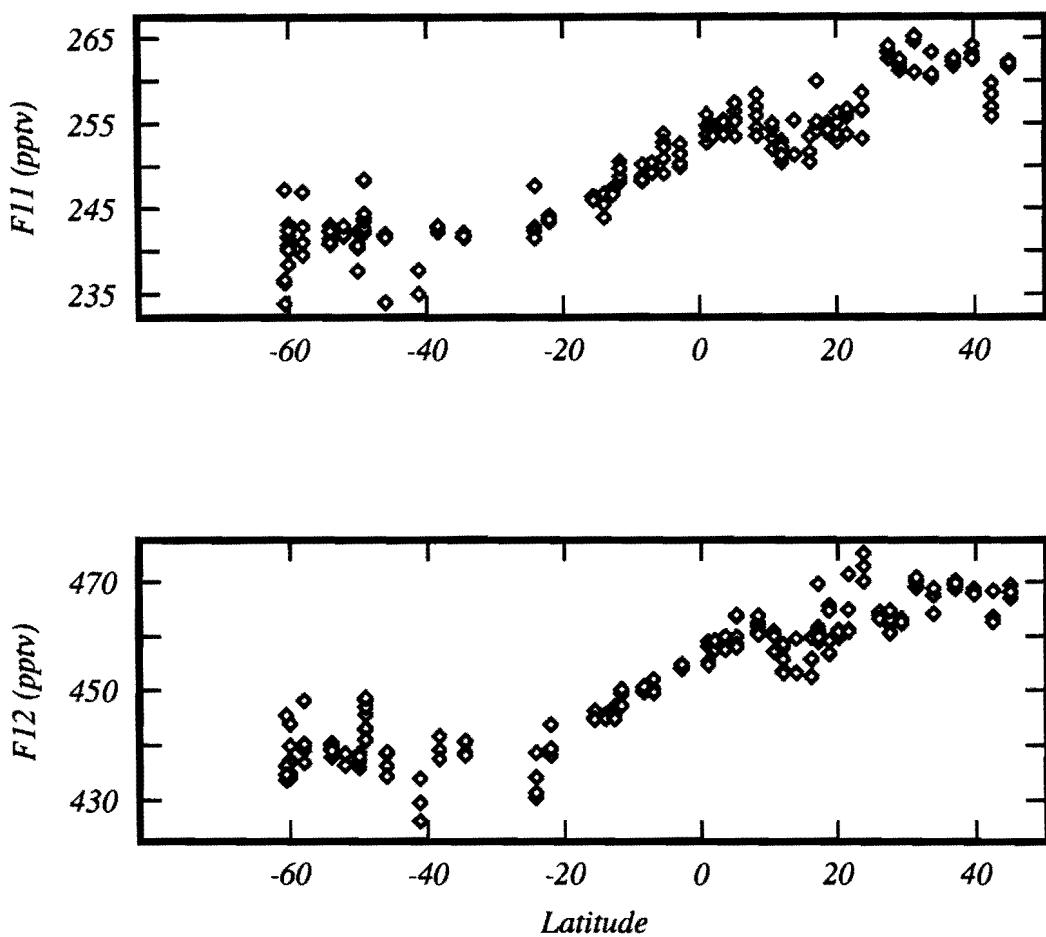

*Leg 2. 15 Feb - 28 Feb, 1989
Manzanillo - Easter, Island*

*Leg 3. 3 March - 2 April, 1989
Easter Island - Papeete, Tahiti*

*Leg 4. 7 April - 20 May, 1989
Papeete, Tahiti - Seattle*

*Atmospheric Measurements during the CO2-89 cruise.
The average northern hemisphere concentrations of the
two CFC's are 257.6 and 463.5 for CFC-11 and CFC-12,
respectively. The average southern hemisphere concentrations
are 242.7 and 440.1.*

*Potential Temperature section along 105° West during the CO2-89 Cruise.
Station numbers are indicated across the top.*

Salinity section along 105°W during the CO2-89 Cruise.
Station numbers are indicated across the top.

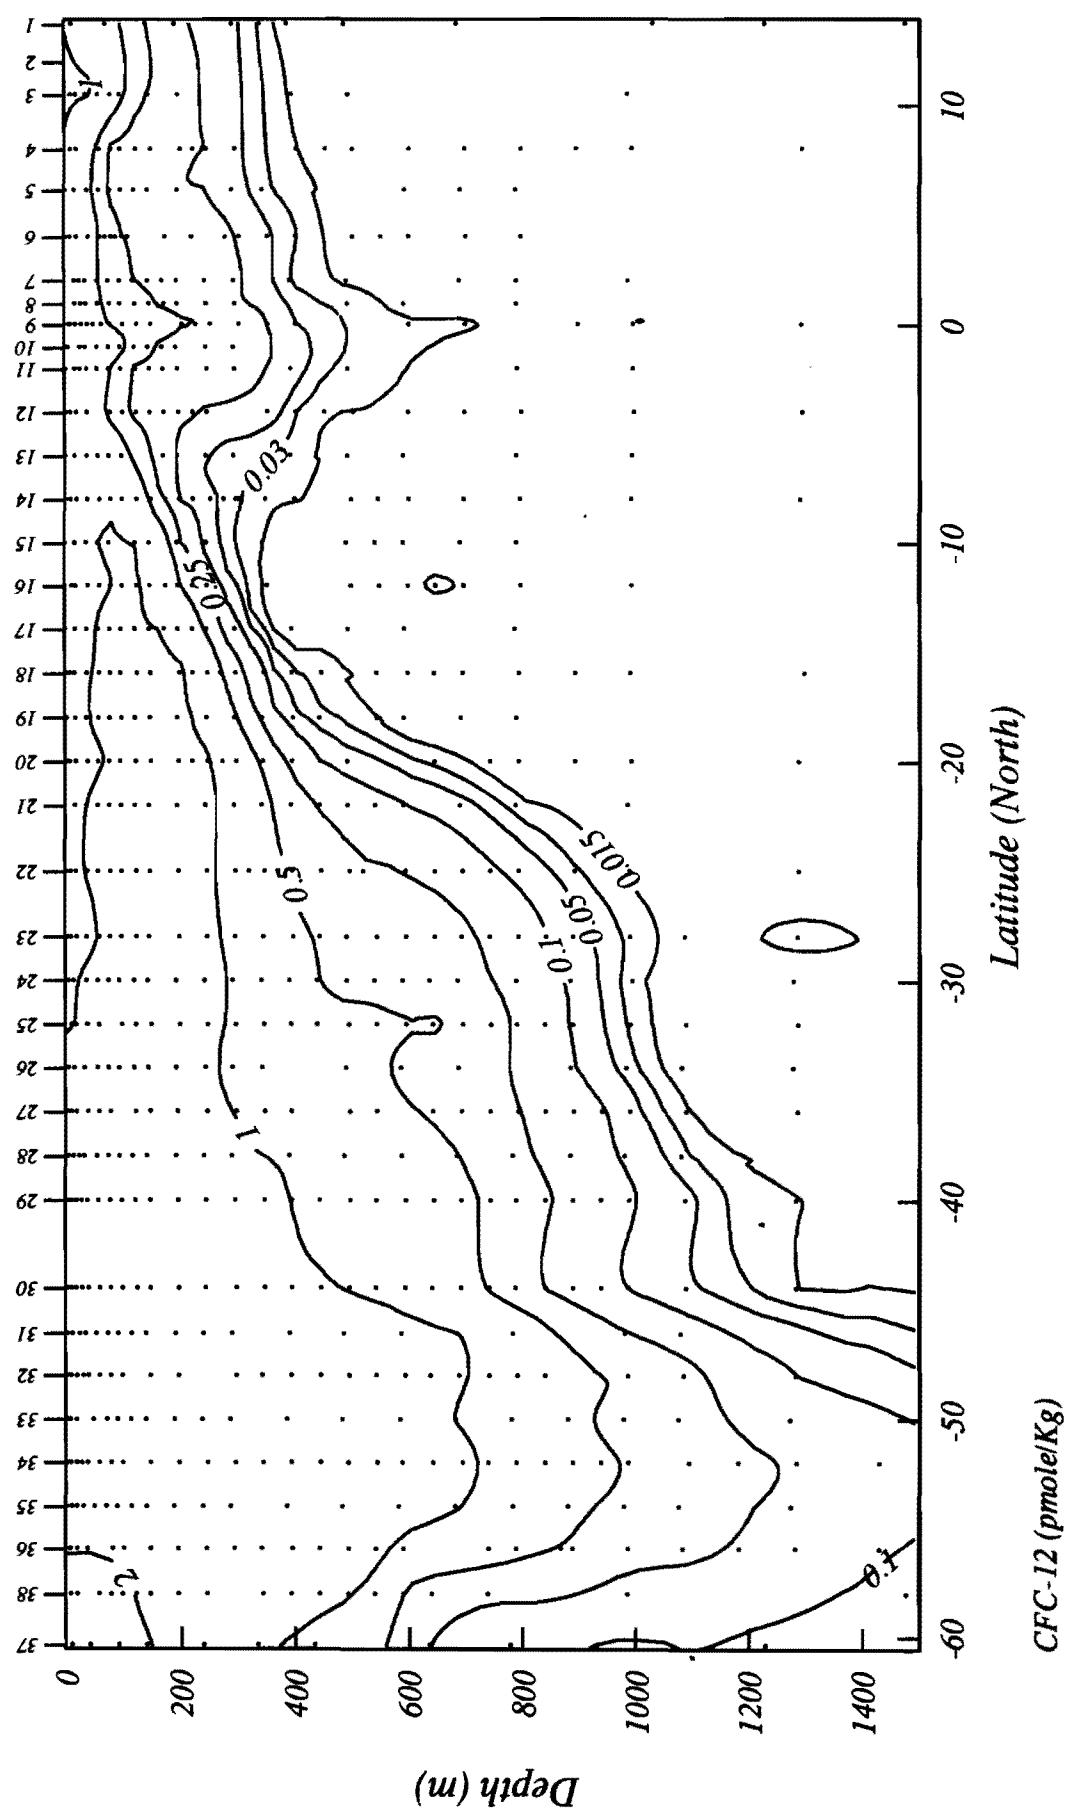

*Dissolved Oxygen section along 105° West during the CO₂-89 Cruise.
Station numbers are indicated across the top.*

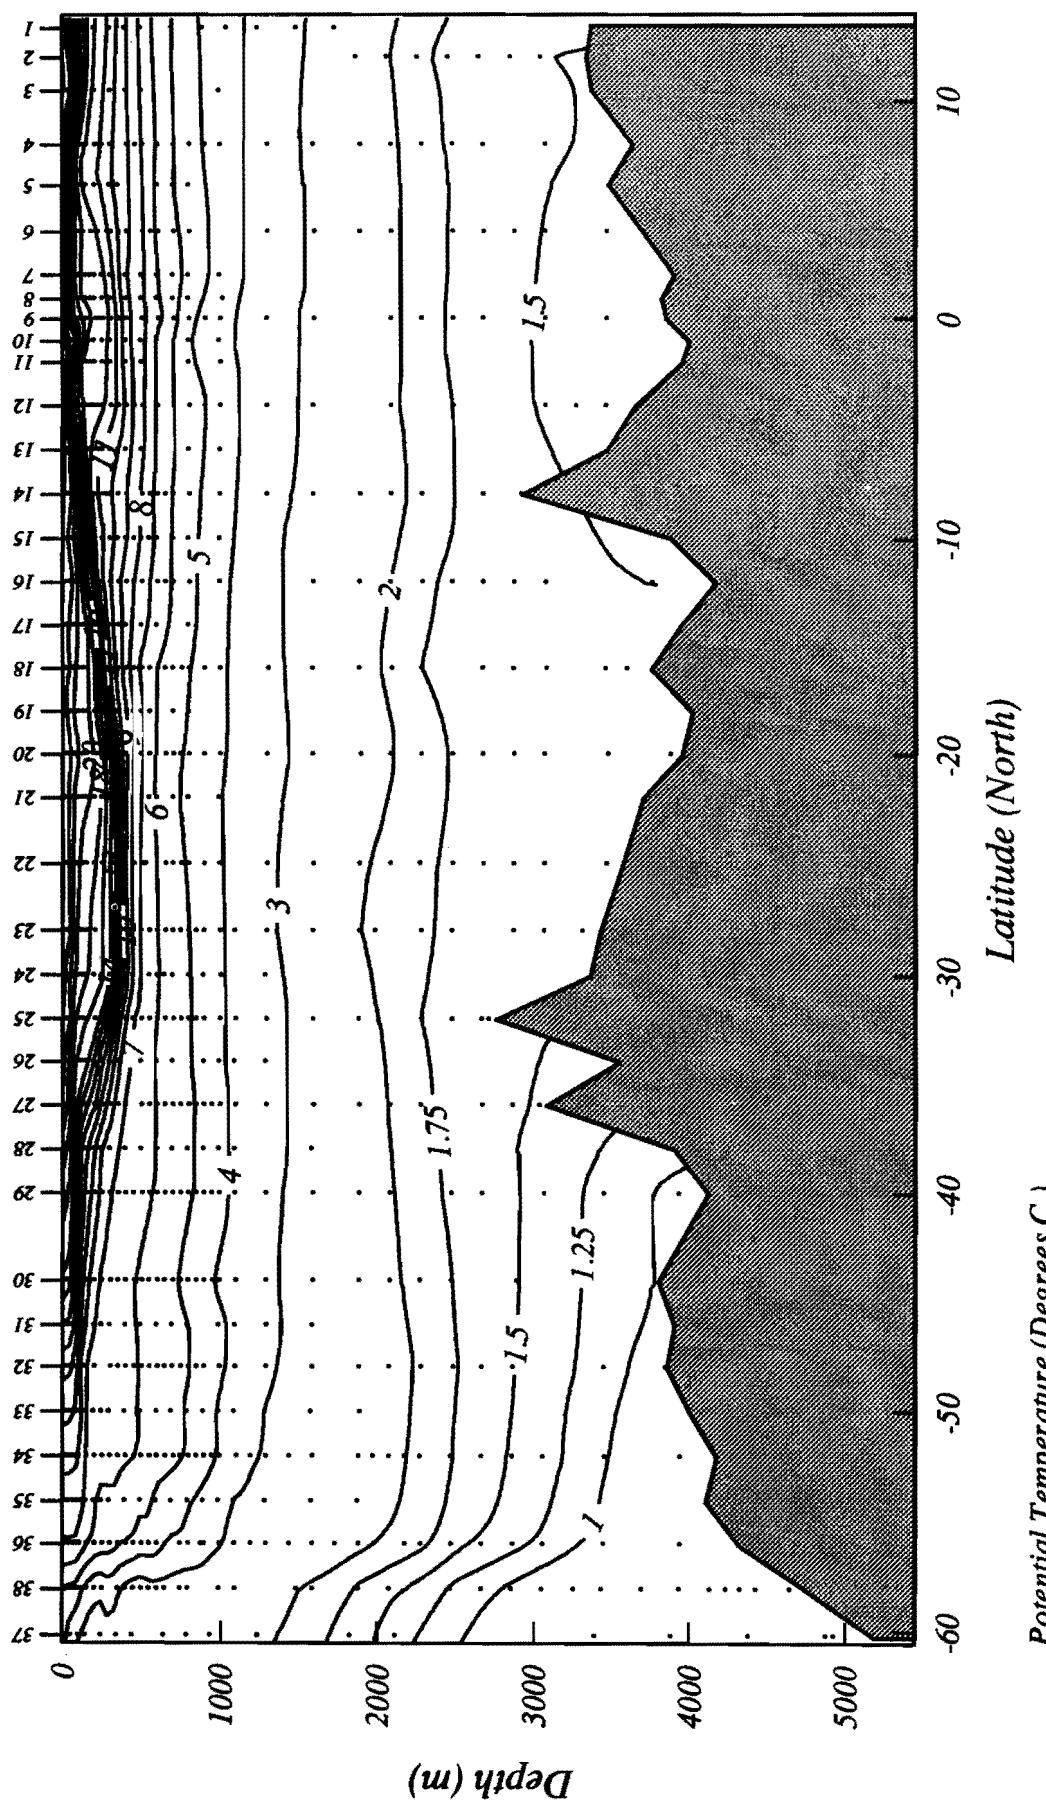

*CFC-11 section along 105°W during the CO2-89 Cruise.
 Station numbers are indicated across the top.*

CFC-11 (pmole/Kg)

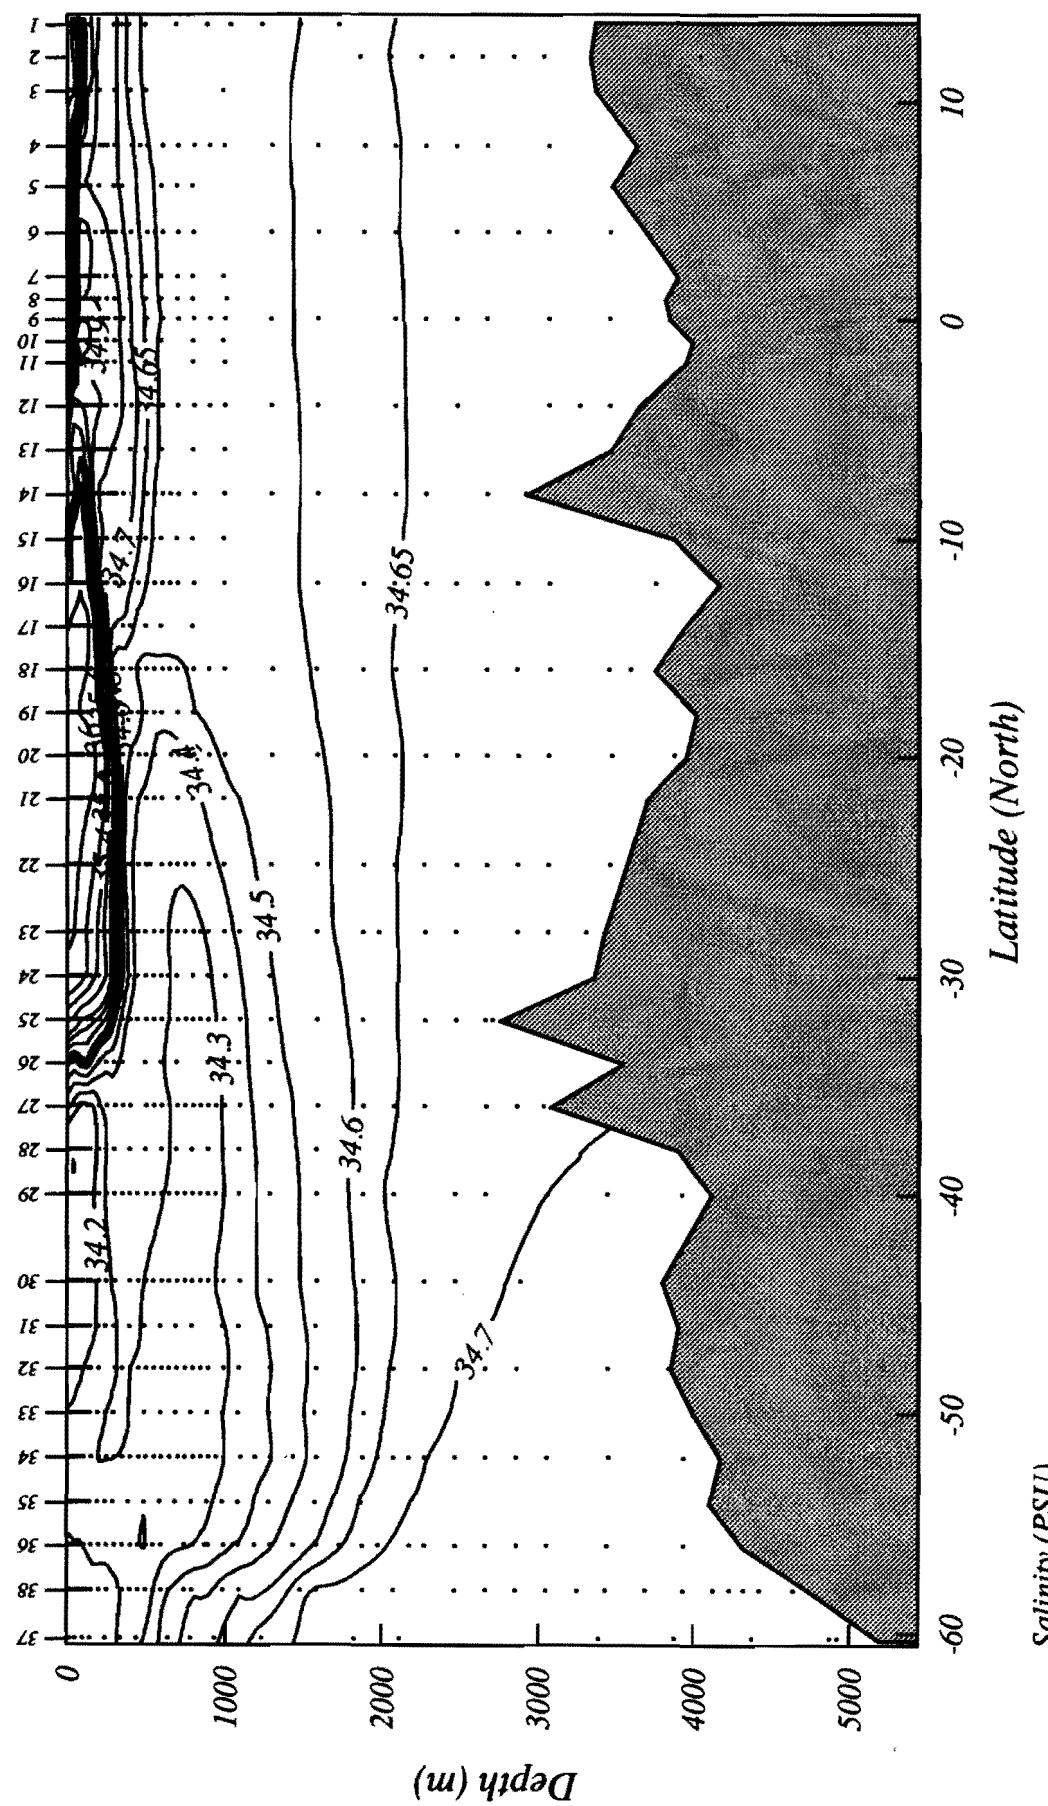

CFC-12 section along 105°W during the CO2-89 Cruise.
Station numbers are indicated across the top.

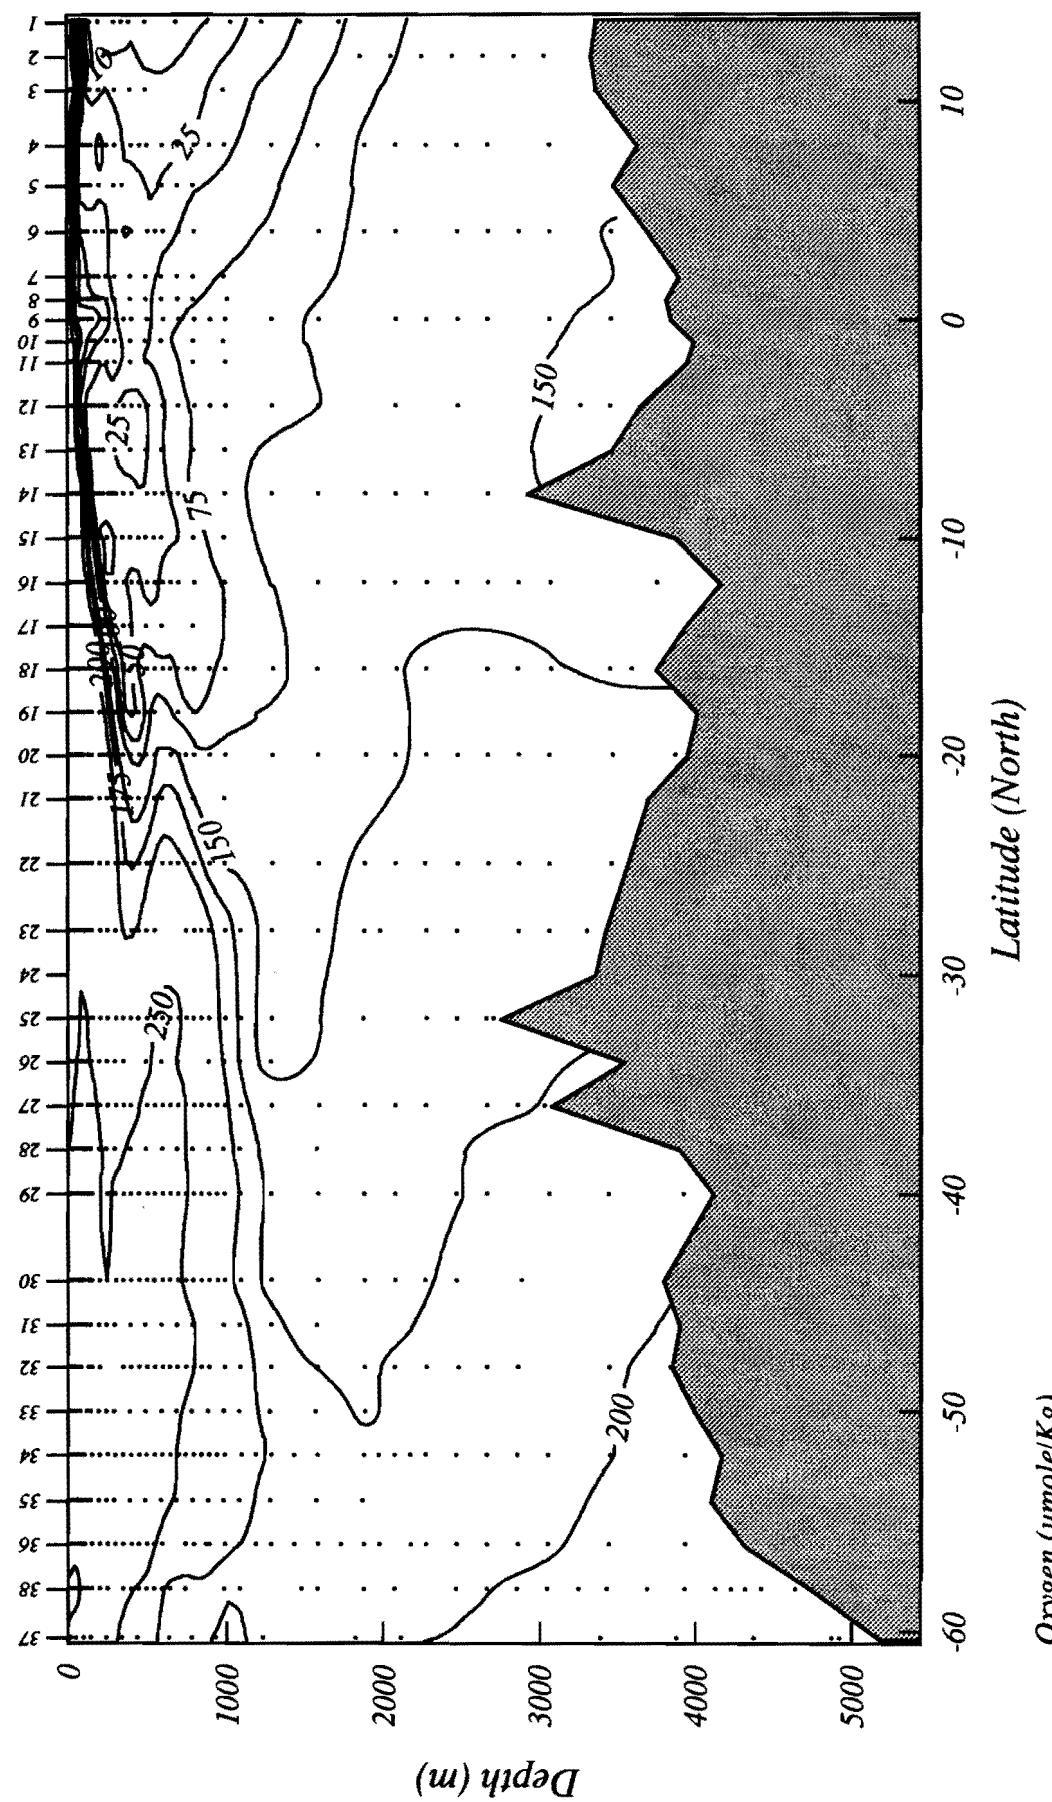

*Potential Temperature section along 105° West during the CO2-89 Cruise.
Station numbers are indicated across the top.*

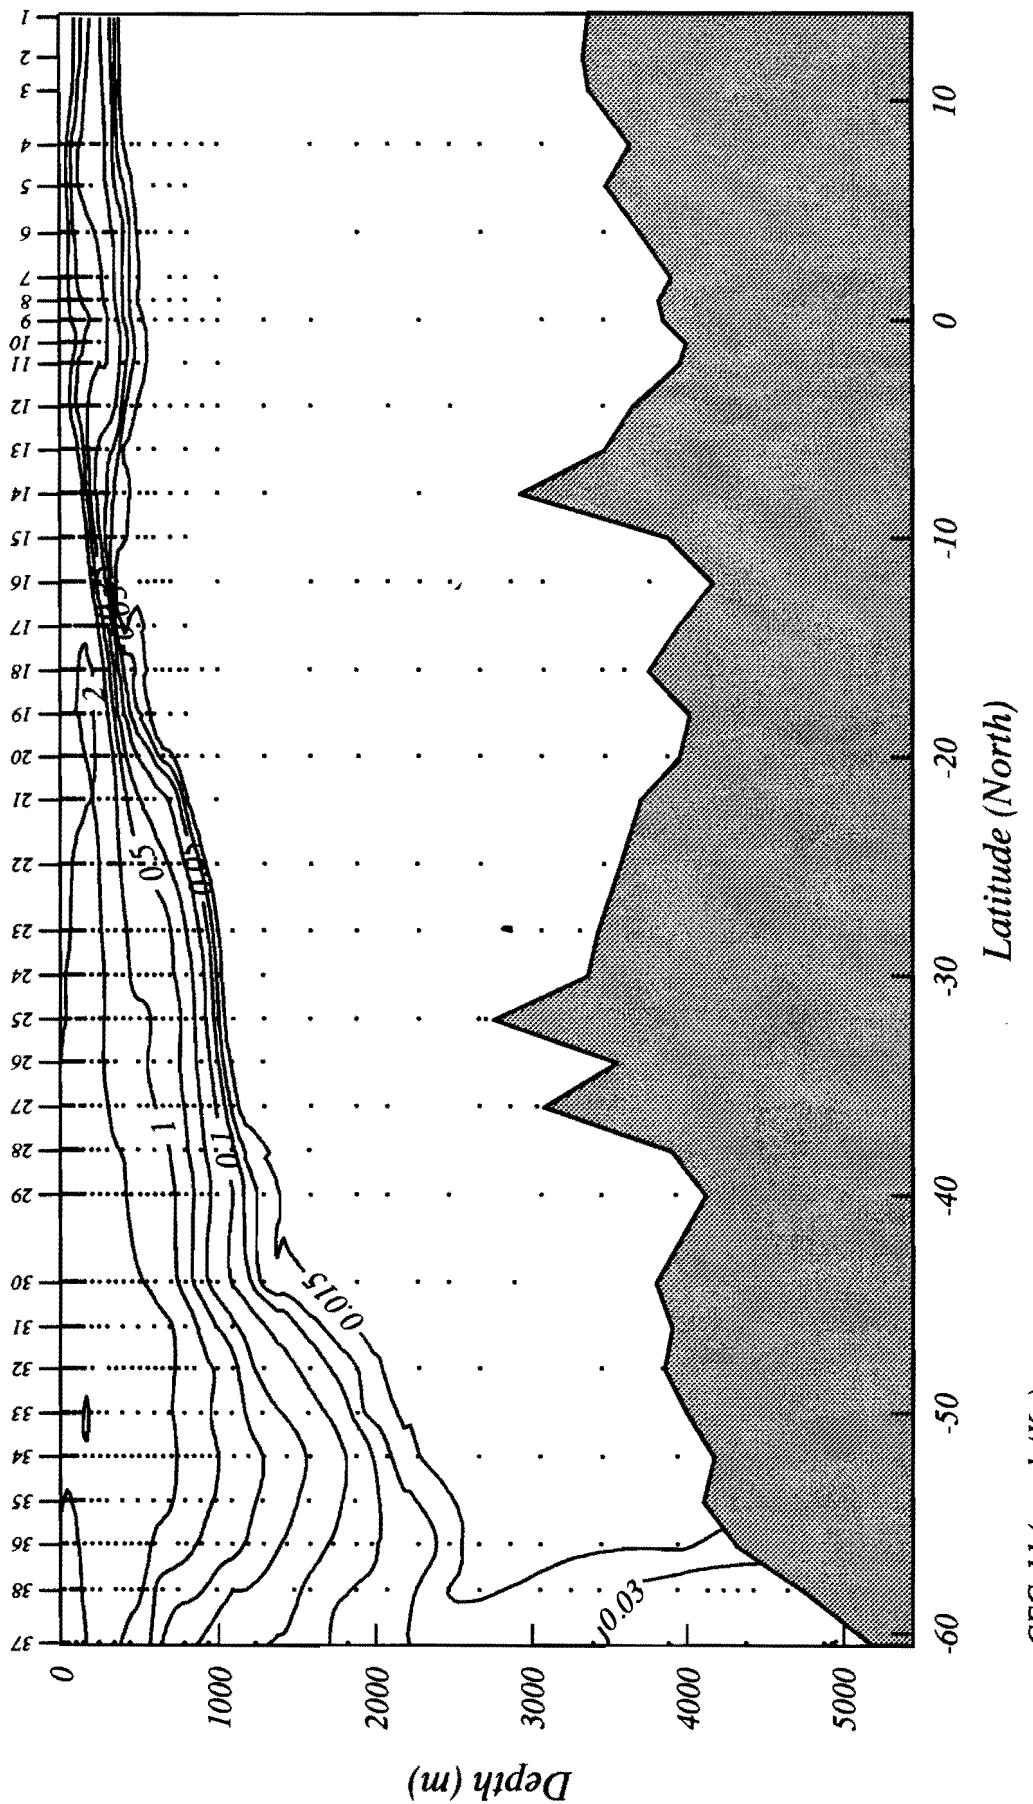

Potential Temperature (Degrees C.)

Salinity section along 105° West during the CO2-89 Cruise.
Station numbers are indicated across the top.

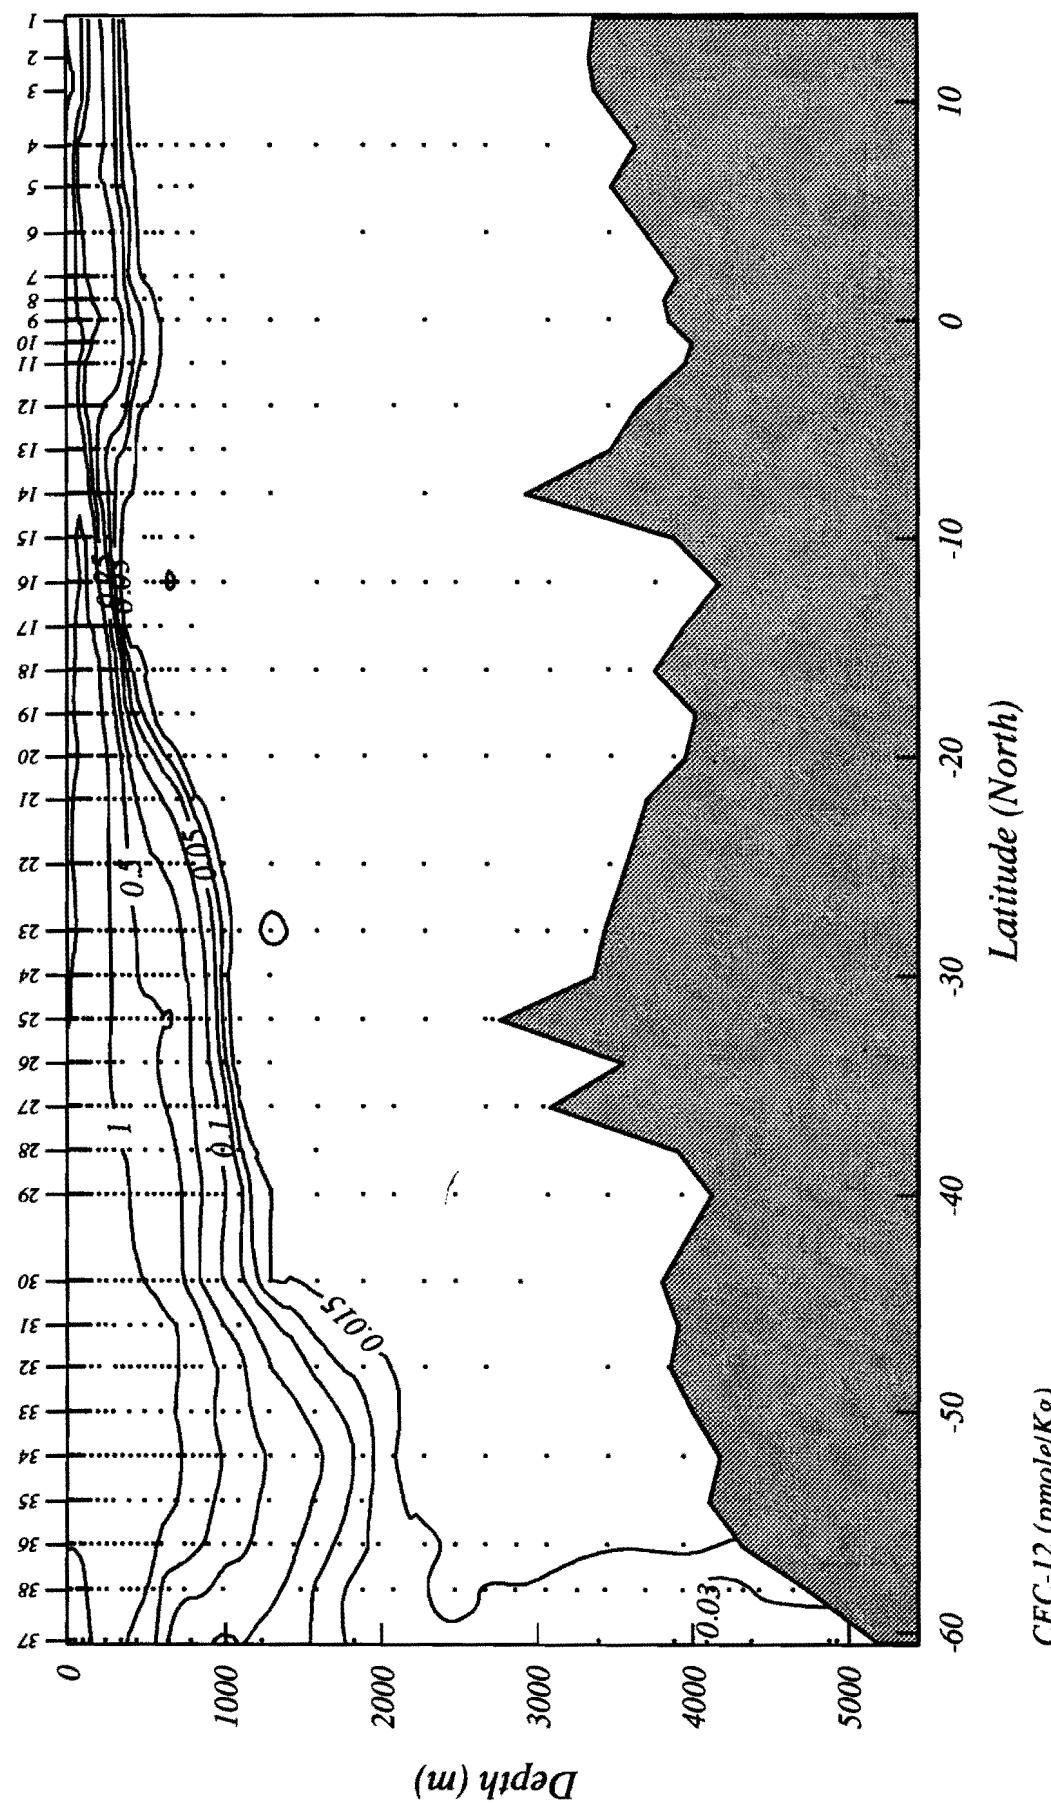

*Dissolved Oxygen section along 105°W during the CO2-89 Cruise.
Station numbers are indicated across the top.*

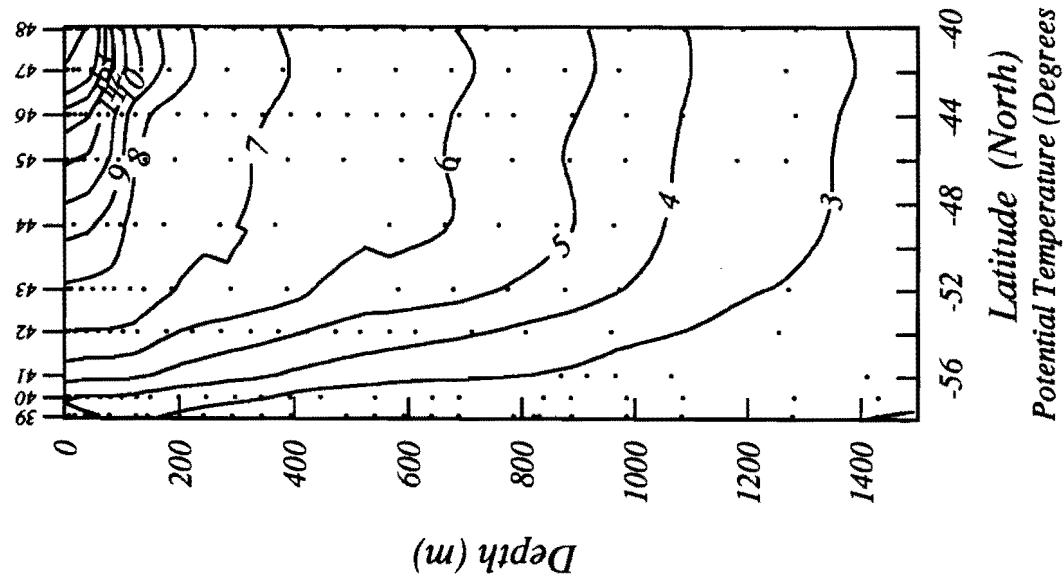

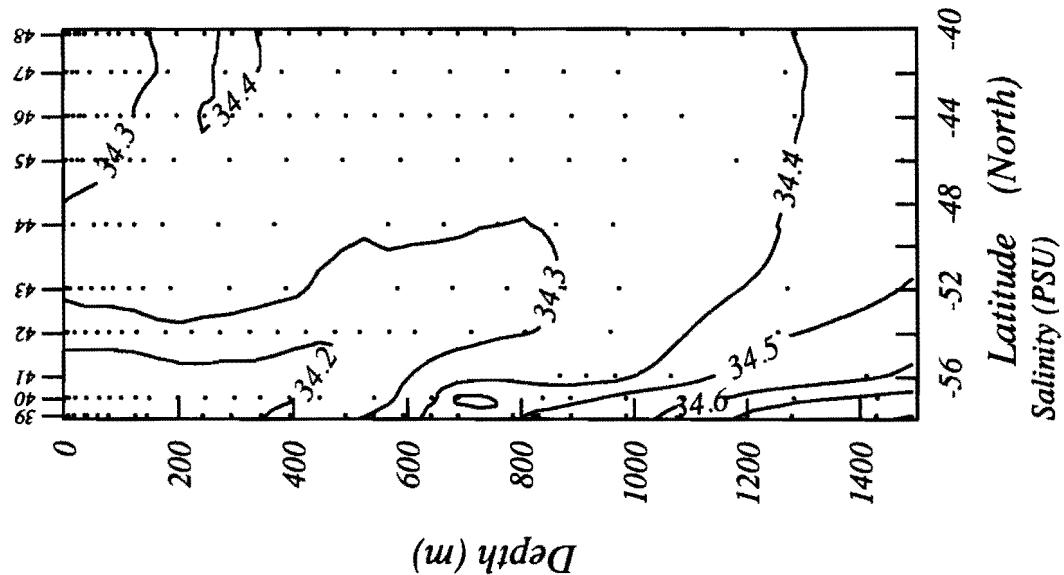

*CFC-11 section along 105 West during the CO2-89 Cruise.
 Station numbers are indicated across the top.*

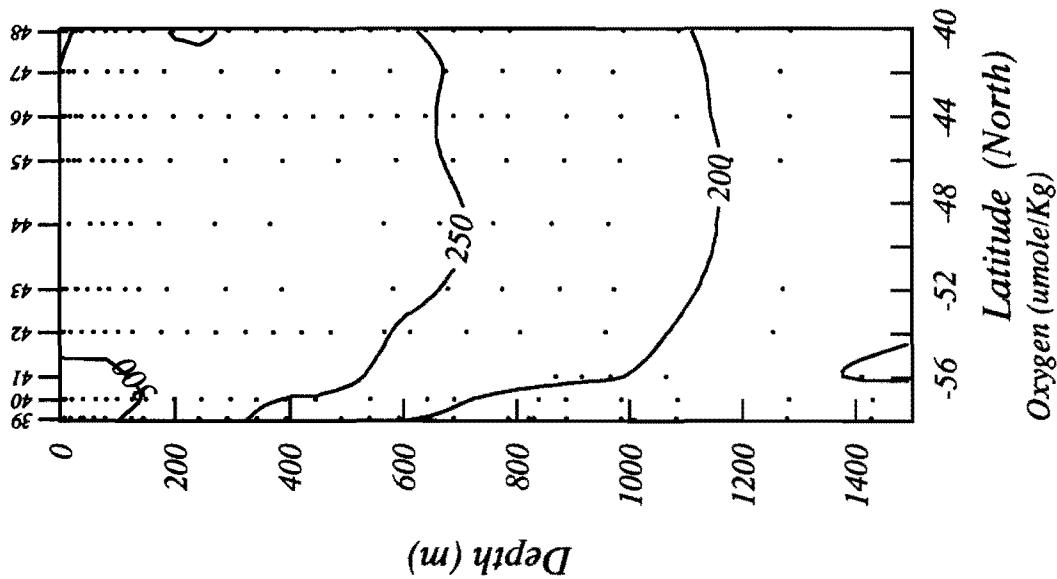

CFC-11 (pmole/Kg)

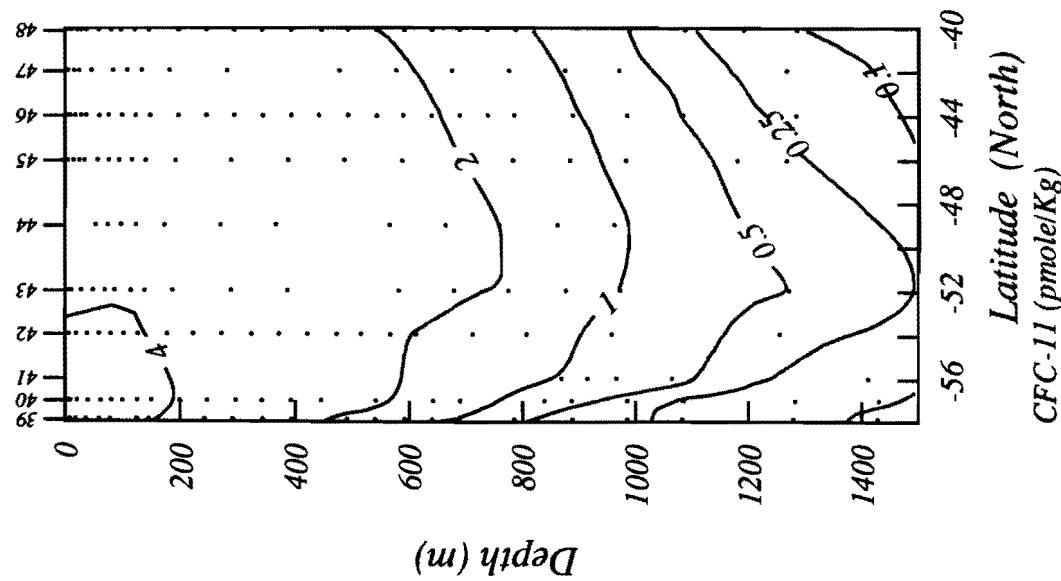

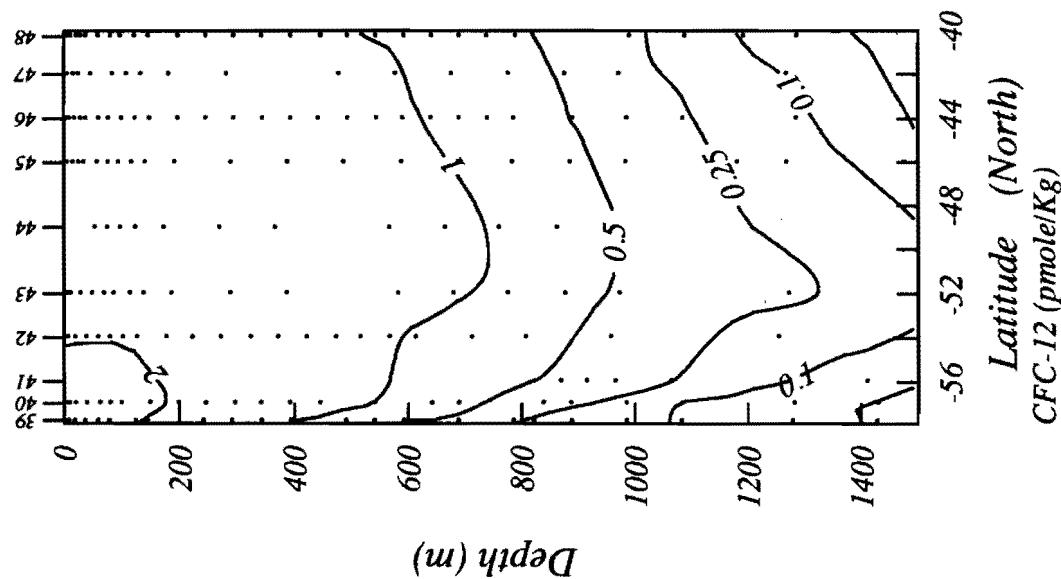

*CFC-12 section along 105°W during the CO2-89 Cruise.
 Station numbers are indicated across the top.*

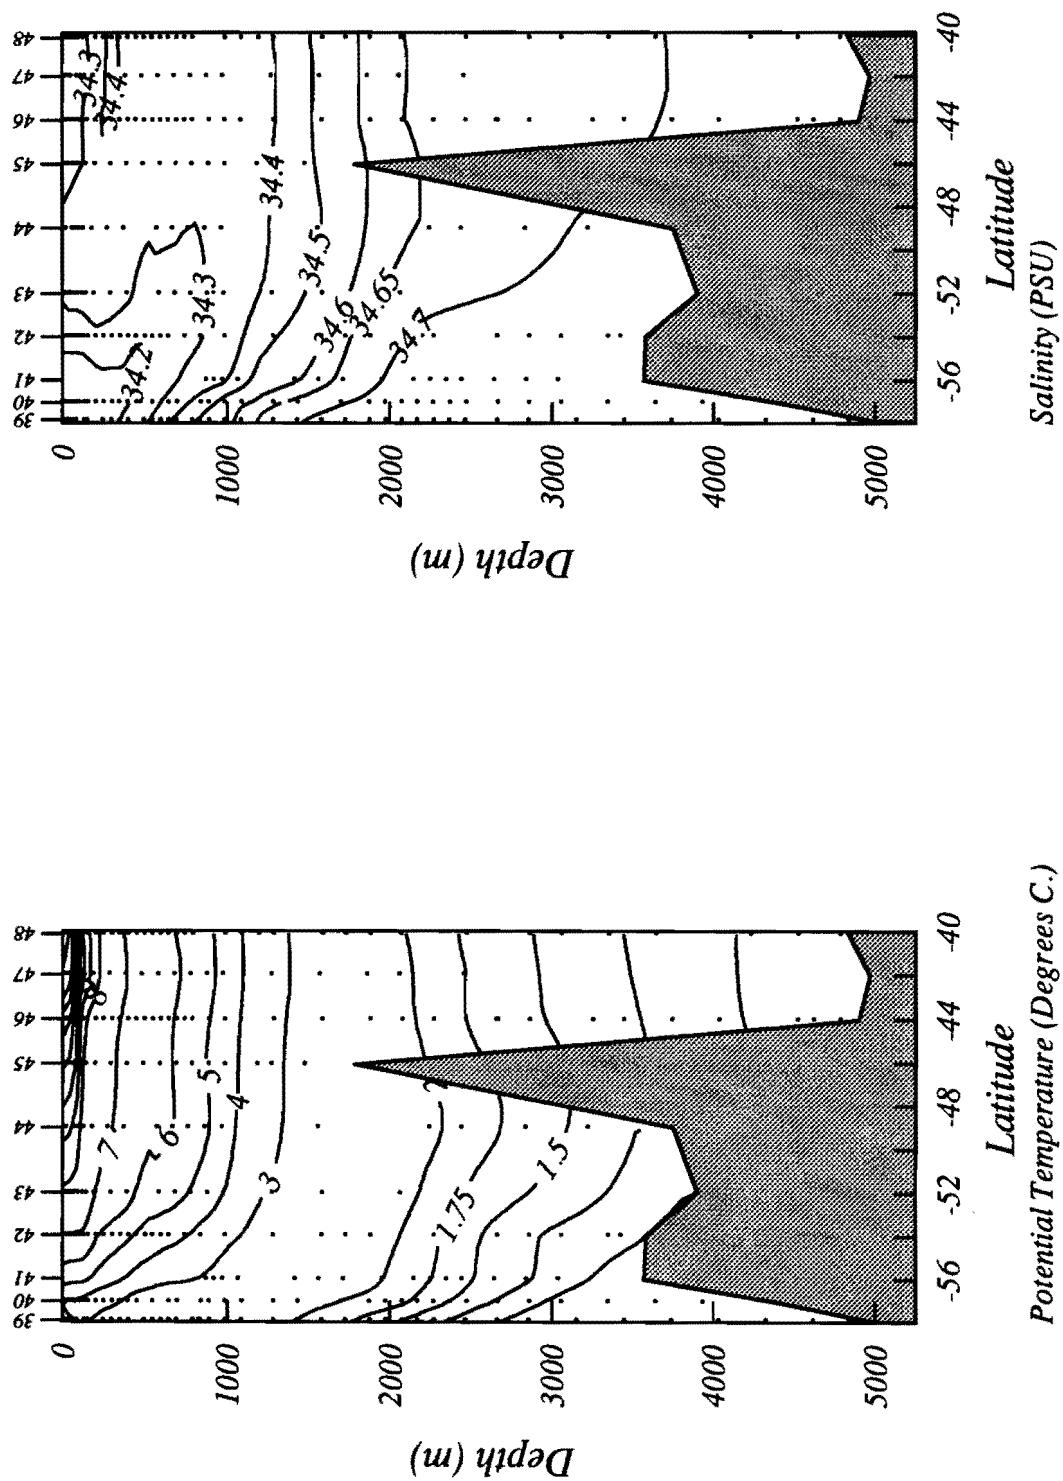

*Potential Temperature and Salinity section along 130 W during the CO2-89 Cruise.
Station numbers are indicated across the top.*

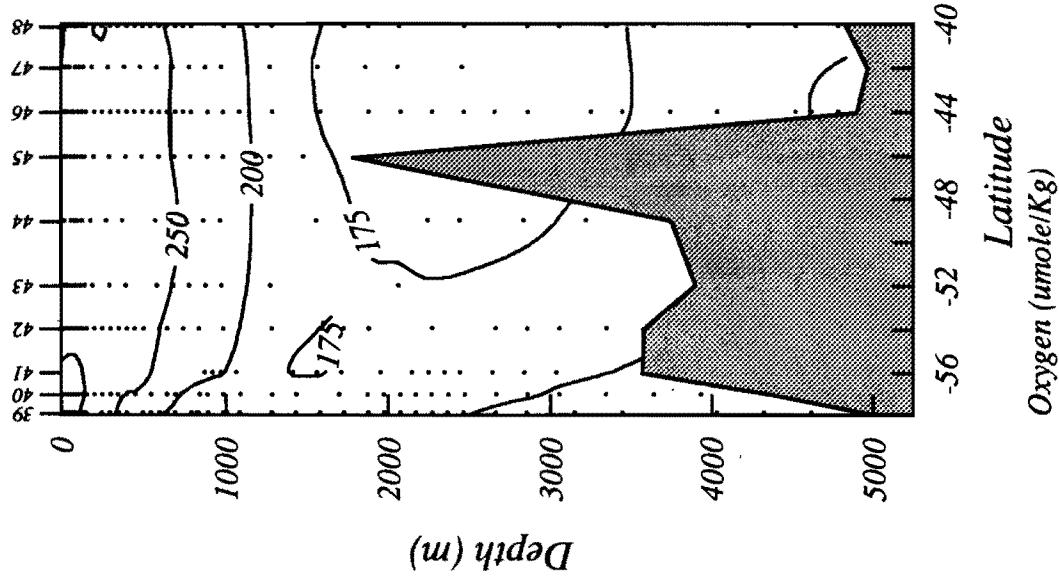

*Dissolved Oxygen section along 130 W during the CO₂-89 Cruise.
Station numbers are indicated across the top.*

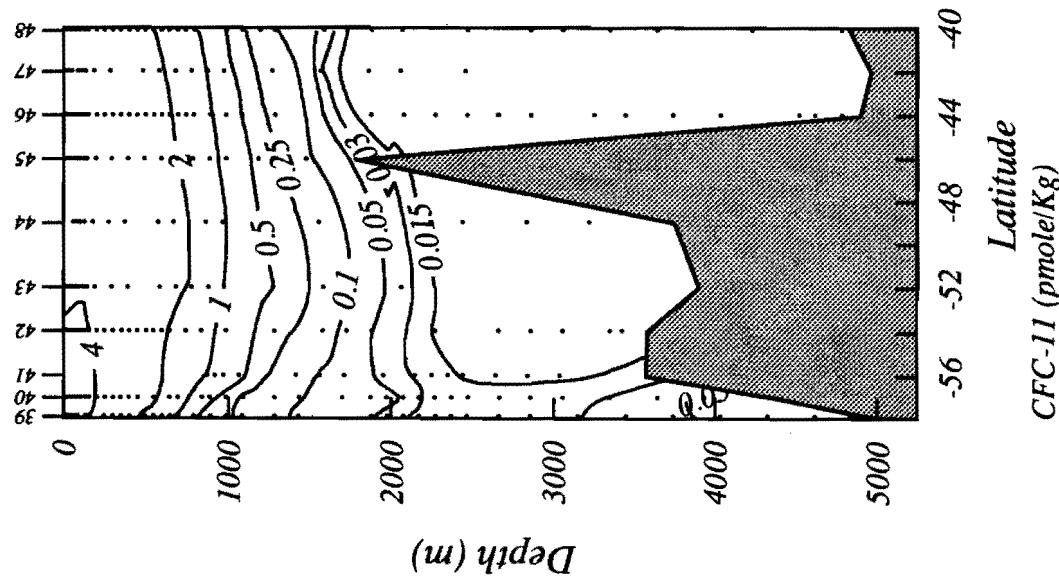

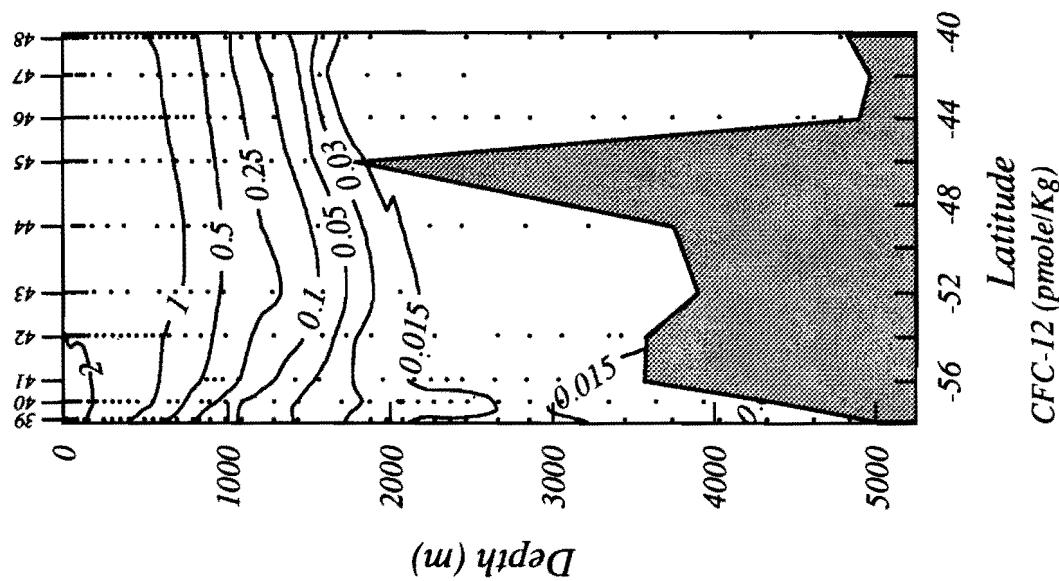

*CFC-11 and CFC-12 section along 130°W during the CO2-89 Cruise.
Station numbers are indicated across the top.*

*Potential Temperature and Salinity sections along 130°W during the CO2-89 Cruise.
Station numbers are indicated across the top.*

*Dissolved Oxygen section along 130 W during the CO2-89 Cruise.
Station numbers are indicated across the top.*

CFC-11 and CFC-12 section along 130 W during the CO2-89 Cruise.
Station numbers are indicated across the top.
