

Instrumentation, Recording systems

Data transmission & Archiving

Topics covered:

- Types of seismic instruments
- Other equipment needed
- How sensors are installed
- Data transmission (telemetry)
- Data archiving (storage)

Seismometer:

- An instrument to record seismic waves (vibrations caused by earthquakes or explosions)

A simple seismometer

A large seismometer – 1200kg, 2m

Today's seismometers use electromagnetic feedback to hold the mass still. This allows seismometers to be made more compact and sensitive.

An observatory-
class
seismometer

Streckeisen STS-1 Very Broadband Seismometer

A seismometer
placed in a
borehole.

Teledyne KS-54000-I Borehole Seismometer

Guralp CMG-3T

High frequency seismometers

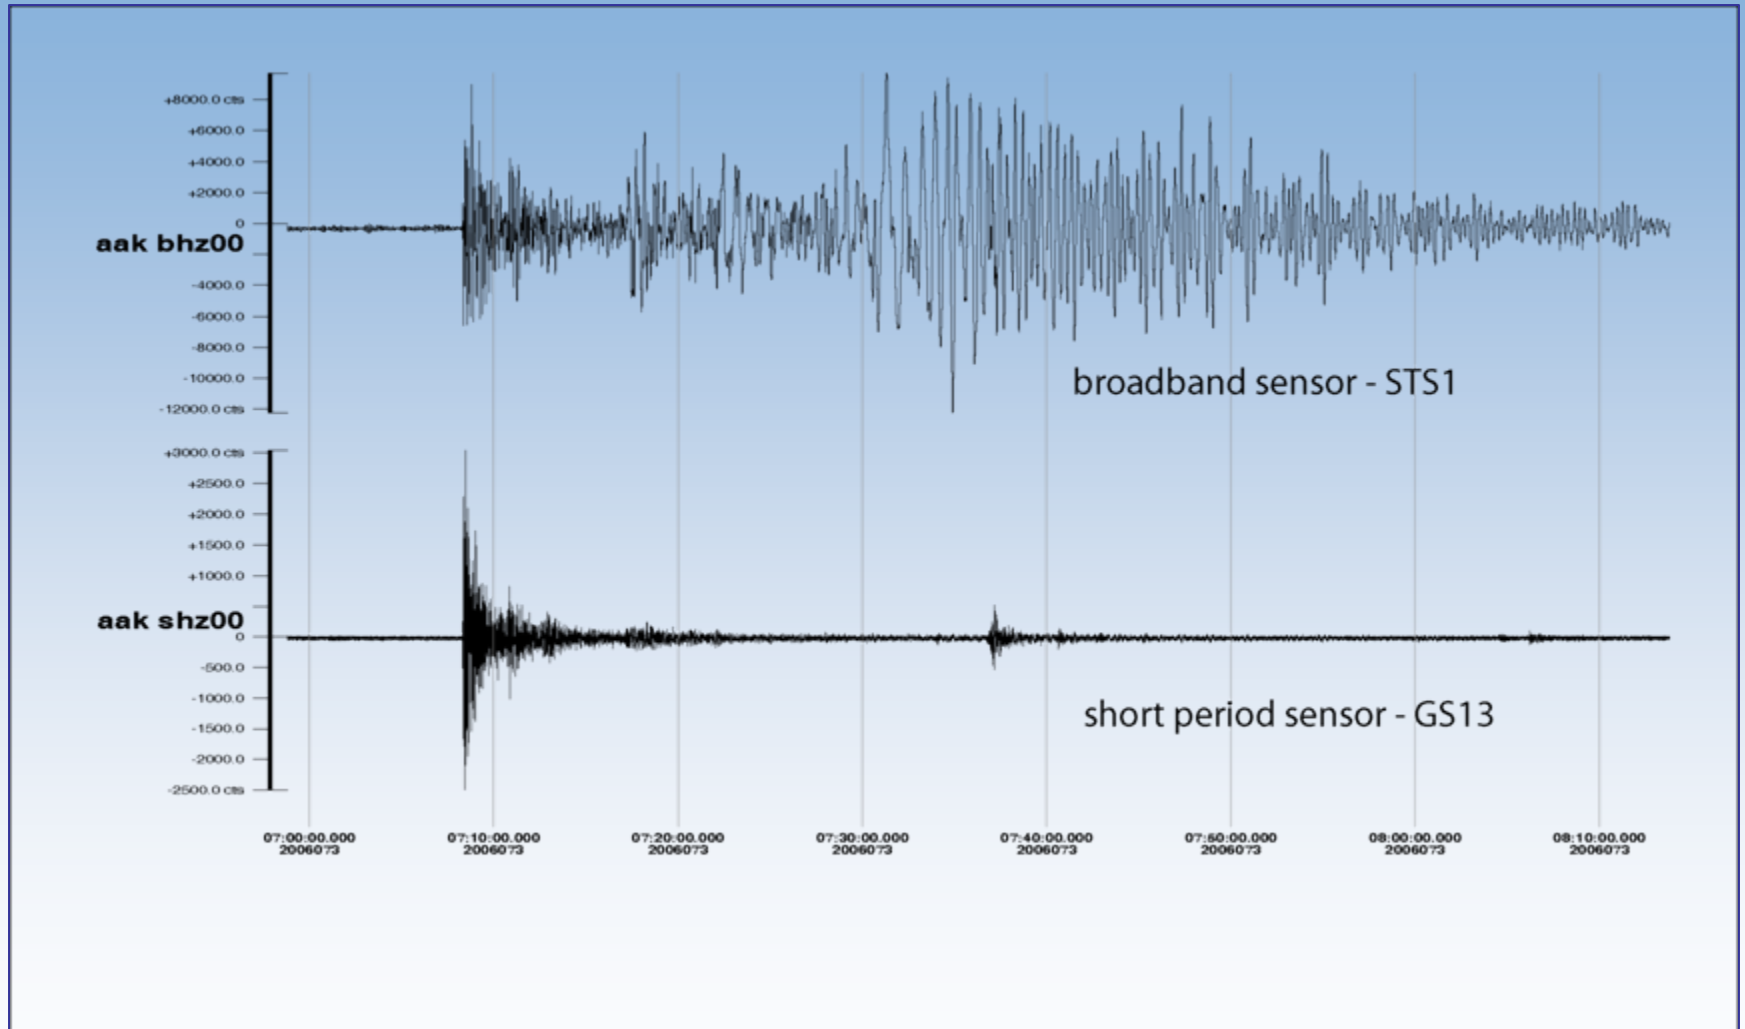

Teledyne GS-13

Streckeisen STS-2

Our eyes see only part of the light from the Sun.

Short period sensors do not record long period signals

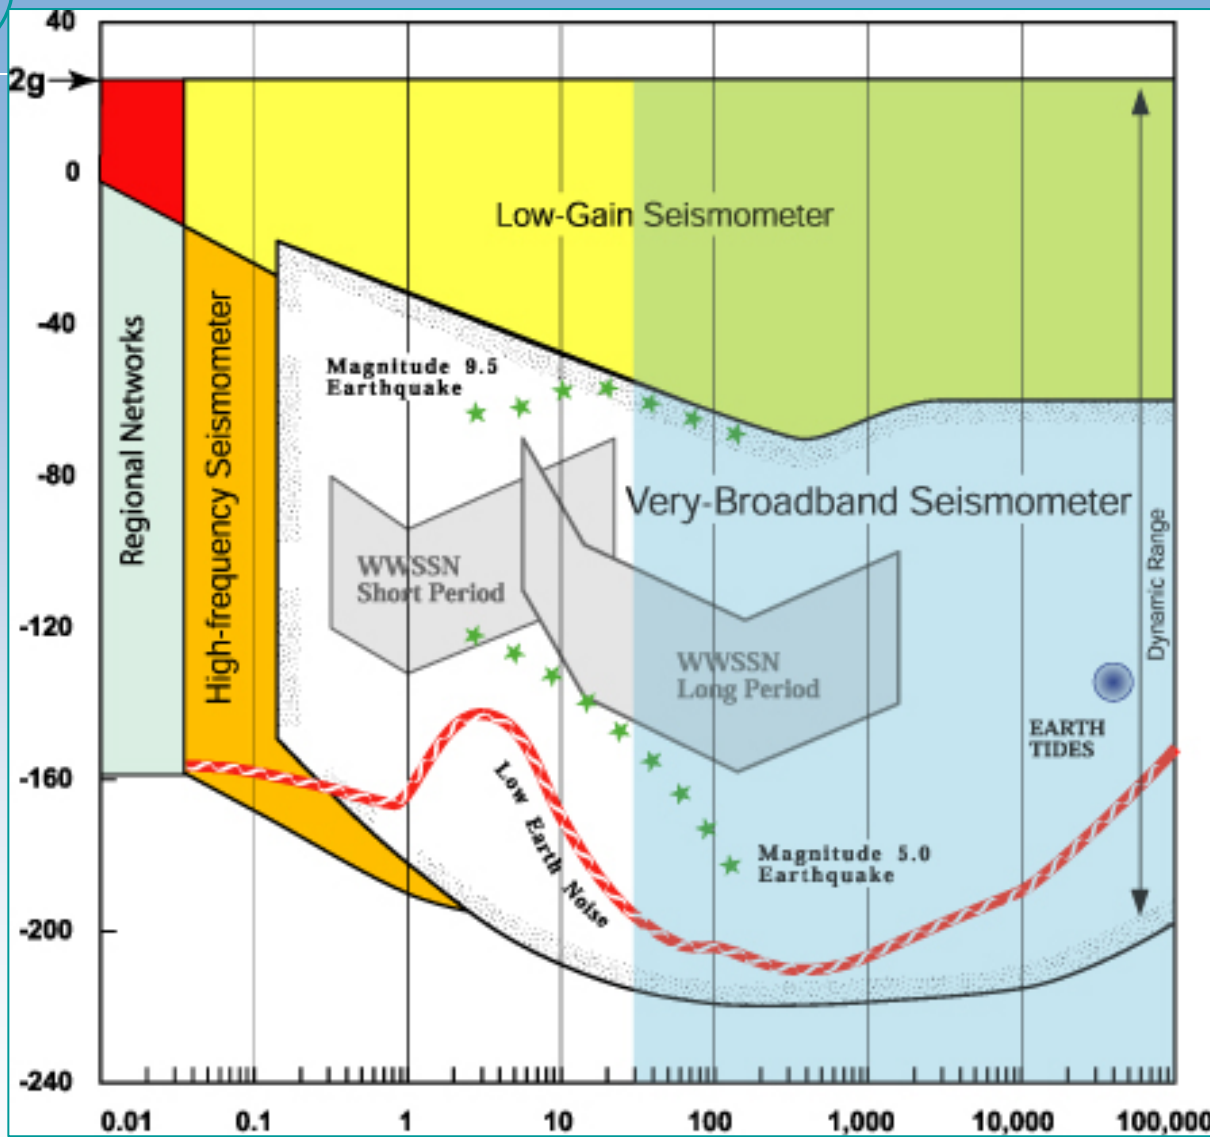

An “insensitive” (strong motion) seismometer: good for recording violent shaking

Kinometrics FBA-23

IRIS GSN SYSTEM

EQUIVALENT EARTH PEAK ACCELERATION (20 LOG M/SEC^2)

PERIOD (SECONDS)

Why more than one kind of seismometer is used

Other equipment needed:

- Clock to time the data

Other equipment needed:

- Clock to time the data
- “DAS” to convert electric current to numbers for a computer to process

IDA MK8 DAS

A New Standard...
www.q330.com

The image shows the Q330HR seismic system components arranged on a bed of smooth, multi-colored pebbles. On the left is a black cylindrical sensor. In the center is a red and blue rack-mounted unit with several circular ports. To the right is a green cylindrical sensor. Cables connect the various units.

Ultra-High Resolution Seismic System

Another popular model

Vault of an observatory

Vault of a regional seismic station

Other kinds of equipment needed:

- Clock to time the data
- “DAS” to convert electric current to numbers for a computer to process
- A source of electric power

Power for an observatory:

Solar power

Thermoelectricity

A regional station:

Where is a good place to put a seismometer?

- Far from human-generated noise (roads and machinery)
- Far from the ocean
- On solid (competent) rock
- In a temperature-stable environment

Recording Room

uplink circuit
wire or radio

Seismometer Borehole

Recording room:

Seismic vault under construction in Madagascar:

Seismic vault under construction in Madagascar:

Vault of an observatory

When a vault or tunnel is not available, a seismometer can be placed in a borehole to reduce noise.

Pallekele, Sri Lanka

At PALK, the wellhead and recording room are very close.

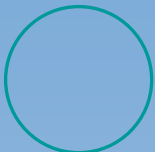

The wellhead cover protects the electronics against damage.

Another important subject...

the DAS

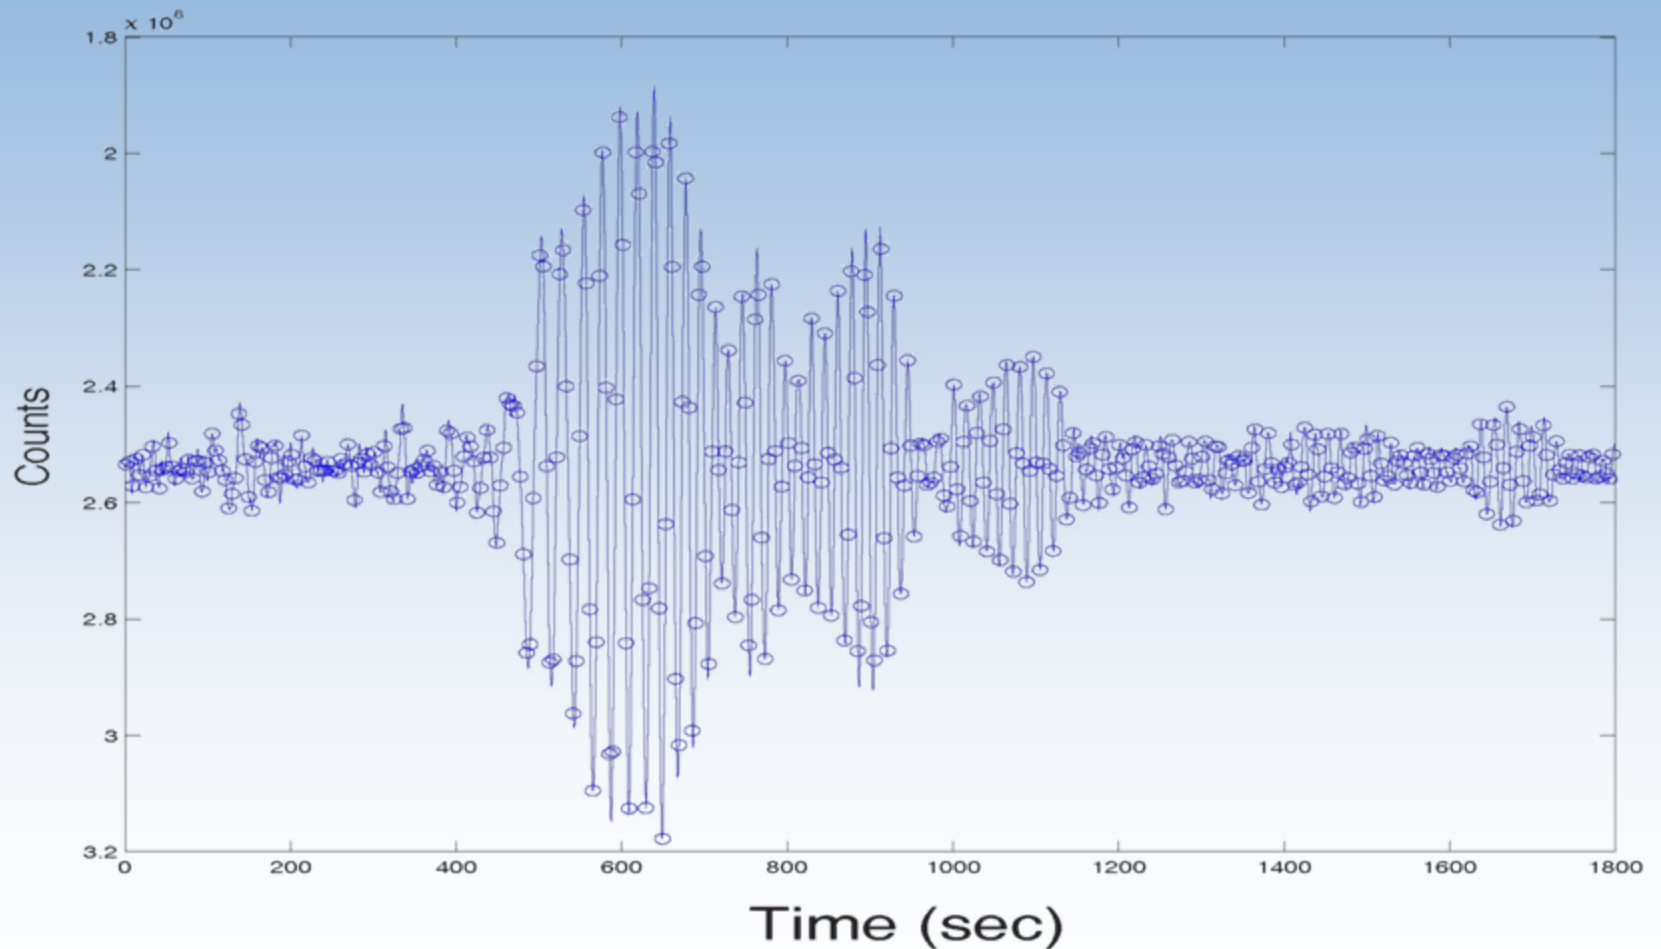

The DAS converts electrical current from the seismometer into numbers to be processed by the computer.

The electrical current from the seismometer is continuous, but the DAS produces numbers only at set intervals of time, the digitization rate. The DAS bundles these numbers into a packet called a data record.

The DAS converts electrical current into numbers.

How the DAS bundles the data depends upon the computer programs running inside the DAS. Some DASs produce a record containing data for a fixed ***period of time***. Other DASs produce a record of a fixed ***size***. In this case, the period of time contained varies from record to record because the data are *compressed*.

compression

This “seismogram” is very simple:

We “compress” 20 numbers into 3 (a , b , c):

Data Telemetry

To transmit data, the following must be considered:

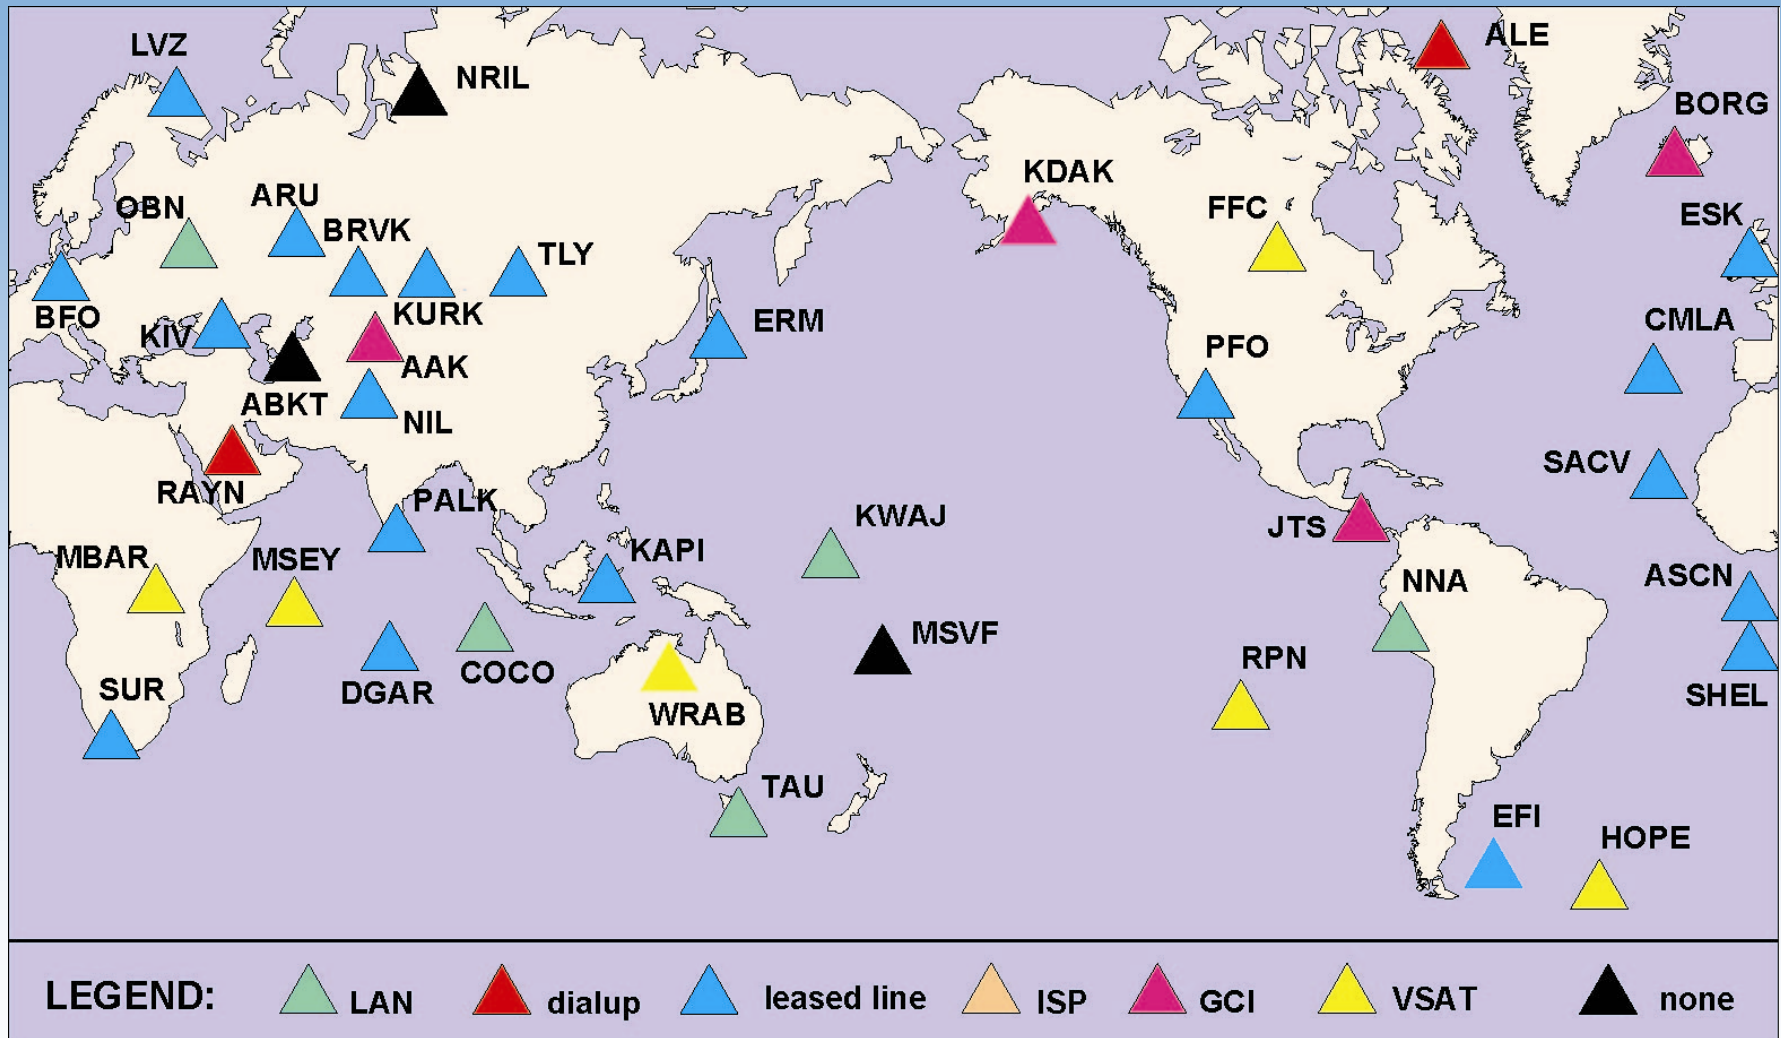

- Type of circuit to carry the data
- Format of the data
- The computer application(s) to manage the data transmission

Types of circuits

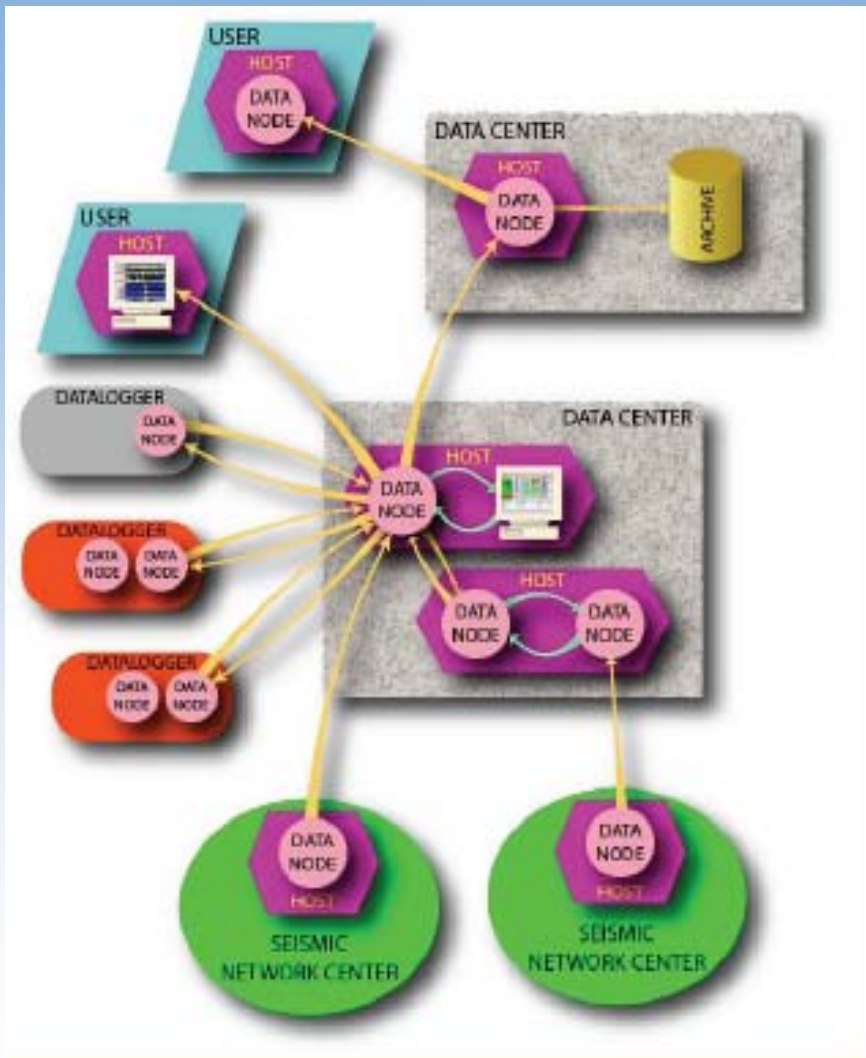

- local area network (LAN)
- leased telephone lines
- VSATs
- local Internet service provider (ISP)

Mbarara, Uganda

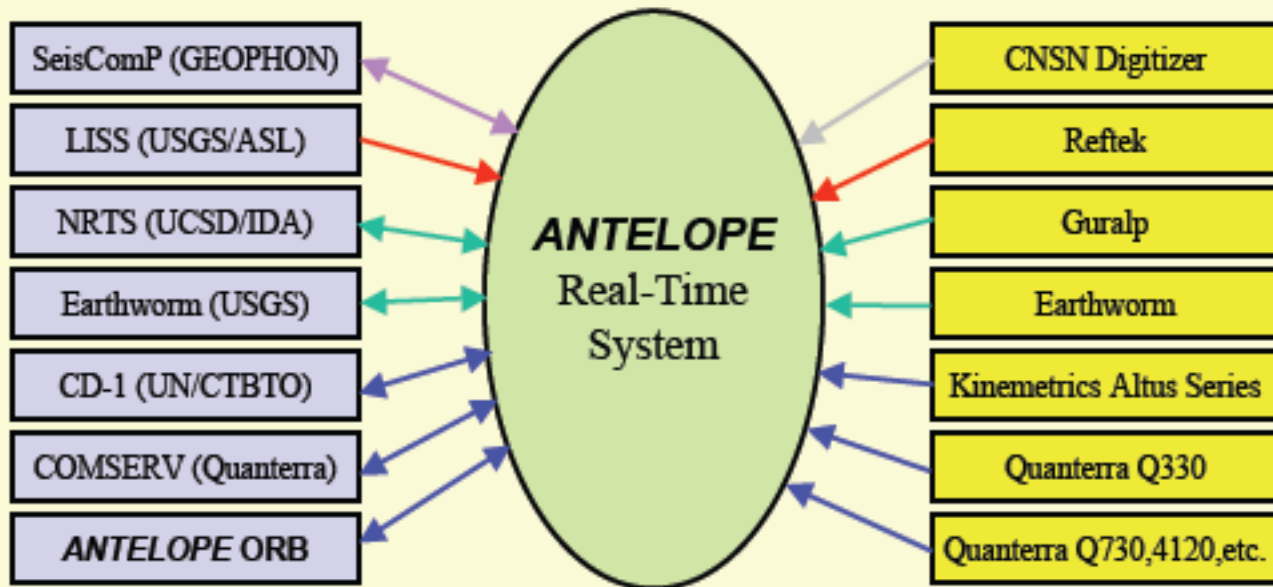

IRIS/IDA Telemetry Topology

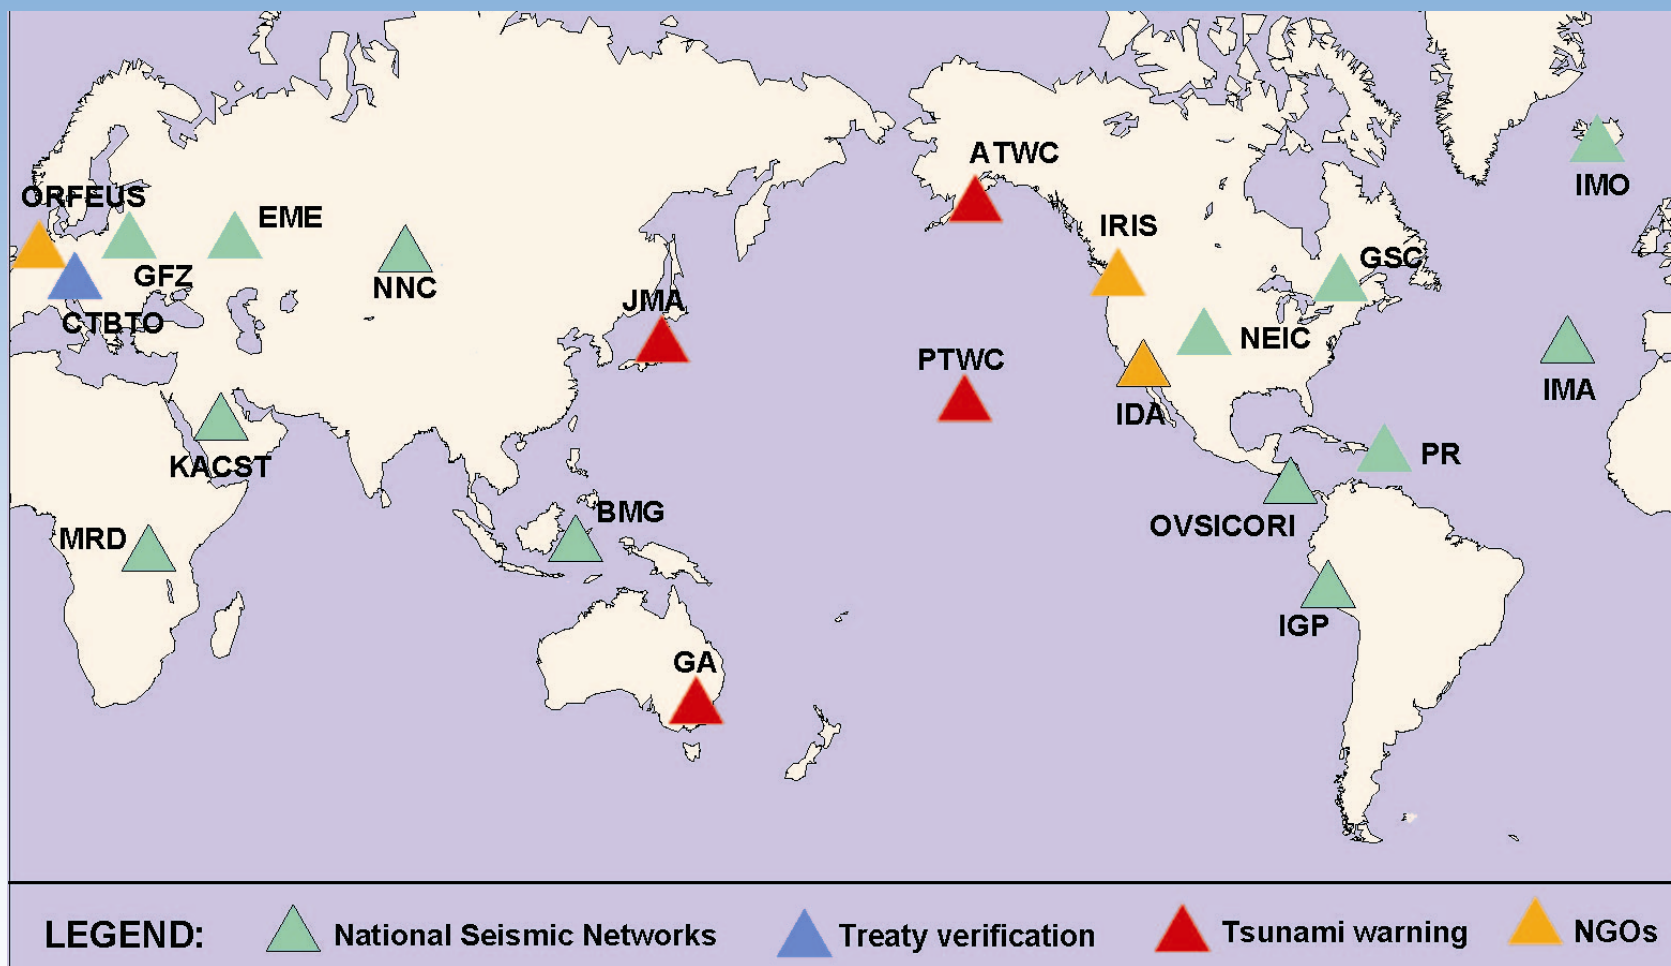

Data formats:

Data records are passed from computer to computer using data telemetry methods. Data centers may pass data to computers from other organizations. By sharing data, both organizations obtain more information.

- ORFEUS, De Bilt, The Netherlands
- UCSD/IGPP, La Jolla, CA, USA
- University of Alaska, Fairbanks, AK, USA
- GSC/PGC, Sydney, BC, Canada
- BRTT, Boulder, CO, USA

Data center software is quite complex. Several packages exist, including this commercial one.

Networks integrating IRIS/IDA Data

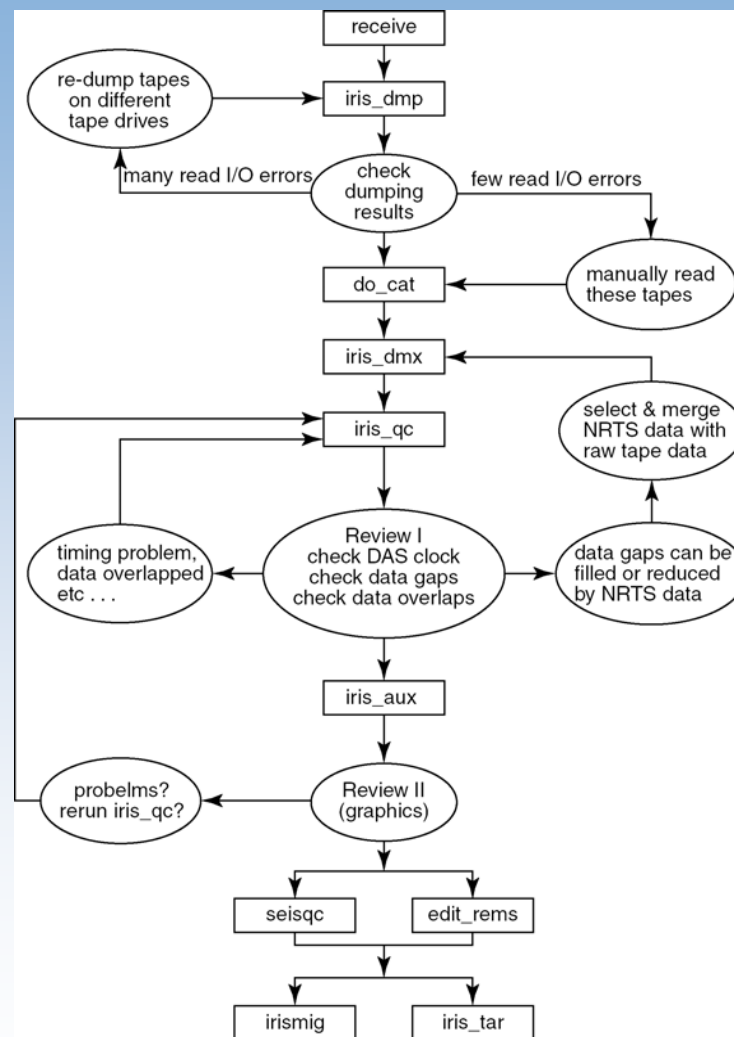

Data archiving: On-site recording media

- DAT tape
- CD-R

In San Diego, comprehensive data analysis

Data are then sent to the IRIS Data Management Center in Seattle, USA where they are available to anyone who requests copies. For more information, see <http://www.iris.edu>.
