Ocean Sciences Meeting 2014
Session #102- The Chukchi Sea Region: Physical Forcing and Ecosystem Response in the Pacific Arctic

February 26, 2014

http://www.arctic.noaa.gov/dbo/
Linking Physics to Biology: the Distributed Biological Observatory (DBO)

- DBO sites (red boxes) are regional “hotspot” transect lines and stations located along a latitudinal gradient.
- DBO sites are considered to exhibit high productivity, biodiversity, and overall rates of change.
- DBO sites will serve as a change detection array for the identification and consistent monitoring of biophysical responses.
- Sites occupied by national and international entities with shared data plan.

[modified by Karen Frey from Grebmeier et al. 2010, EOS 91]
Outline of Presentation

• Seasonal and interannual changes in sea ice extent, duration and seawater temperature

• Chlorophyll standing stock

• Biological response using the benthos as time series indicator

• Upper trophic connections to prey base

• Tracking ecosystem response to changing system
Rationale of the DBO

• Tracking biological responses to physical drivers in the Arctic requires coordinated, multidisciplinary field sampling.

• Many developing observation systems in the Arctic are focused on physical sensors, but biological sampling across a range of spatio-temporal scales is required to detect ecological shifts in response to environmental forcing.

• Coordinated ship-based sampling, coincident with data streams from satellites and moorings will provide an early detection system for biological shifts in the Arctic.
## DBO Pilot Study: 2010-2013

Distributed Biological Observatory
Standardized Sampling Protocols

Core ship-based sampling:
• CTD and ADCP
• Chlorophyll
• Nutrients
• Ice algae/Phytoplankton (size, biomass and composition)
• Zooplankton (size, biomass and composition)
• Benthos (size, biomass and composition)
• Seabird surveys (standard transects, no additional shiptime)
• Marine mammal surveys (no additional ship time)

Second tier ship-based sampling:
• Fishery acoustics (less effort than standardized bottom trawling)
• Bottom trawling (every 3-5 years)

DBO sampling by national & international science programs
Sea Ice Persistence, Timing of Break-up, and Freeze-Up from DBO1 (south) to DBO5 (north)

Annual Sea Ice Persistence
- DBO 1
- DBO 2 (-9.21 days/decade)
- DBO 3 (-11.84 days/decade)
- DBO 4 (-29.50 days/decade)
- DBO 5 (-25.30 days/decade)

Timing of Sea Ice Breakup
- DBO 1
- DBO 2 (+3.29 days/decade)
- DBO 3 (+5.22 days/decade)
- DBO 4 (+13.97 days/decade)
- DBO 5 (+12.12 days/decade)

Timing of Sea Ice Freeze-up
- DBO 1
- DBO 2 (+7.84 days/decade)
- DBO 3 (+7.22 days/decade)
- DBO 4 (+15.32 days/decade)
- DBO 5 (+12.72 days/decade)

Summary

• Observe the seasonal warming and freshening of Pacific seawater as it transits northward from the northern Bering Sea to Barrow Canyon, coincident with levels of pelagic and benthic prey bases for larger marine mammals and seabirds

• Repeat time and space collections of various environmental and biological parameters allowing us to evaluate seasonality of ecosystem status and trends

• Continued persistence of benthic “hotspots” spatially, although observations of changes in benthic dominant macrofauna and biomass over last decade

• Latitudinal “change detection array” organized through the Pacific Arctic Group (PAG) & endorsed by the International Arctic Science Committee (IASC) marine working group; designated as SAON (Sustaining Arctic Observing Networks); within US National Ocean Policy and Implementation Plan

• Ongoing effort to develop coordinated data submission, management, access, and publications
Thank you for your attention.
